10. As a guide to the Census Officers a Census Calendar was issued showing the dates on which the several operations had to be commenced and completed up to 20th March 1911. **Census Calendar.**

11. With Census divisions and agency thus constituted and the house-numbering checked with reference to the block lists, a preliminary enumeration was started. This consisted in writing up for each numbered house, the name and particulars of every person living in it, by personal enquiry at each house by the enumerator himself and entered in a schedule, forms of which were supplied to each enumerator made up into books at the Government Press, one for each block and adapted to the size of the blocks assigned to him. The forms of these schedules were the same as those prescribed for British India, except that a sub-column was opened for entry of sub-castes under the main head "Caste." The columns of the Mysore schedule of 1901 providing for more particulars relating to conjugal condition and for sect, gotra, etc., were omitted. The preliminary enumeration commenced on or about the 15th January 1911 in rural areas and the 1st February in urban areas and was completed with more or less speed everywhere so as to allow of the schedules being well examined and all errors rectified before the final enumeration on the 10th March 1911. **Preliminary enumeration.**

12. In the meantime, notices were issued to all residents of villages and towns warning them as far as possible to remain in their houses on the night of the 10th March, to keep the front doors of their houses open, to keep their dogs muzzled and to help the Census enumerator with a light when he would call. **Notice to the public.**

13. To allow of all available officials helping in this final enumeration and to facilitate the preparation of provisional totals, all Public Offices, Courts and Schools in the State were closed for three days on the 9th, 10th and 11th March 1911. **Closing of public institutions.**

14. Special arrangements were made for the enumeration of jails, lock-ups, hospitals and dispensaries. Special enumerators were appointed in respect of jatras, fairs and festivals at which pilgrims, visitors, shop-keepers, etc., were likely to remain on the night of the 10th March 1911. Travellers' enumeration tickets were issued to persons enumerated at these fairs and festivals. **Special arrangements for Census of Jails, etc.**

15. The final enumeration or Census proper consisted in the enumerator going round the areas assigned to him, schedule book in hand, rapidly comparing the preliminary record with the facts subsisting on the night of the 10th March and correcting it by adding or striking off names as may be found necessary. In a few forest tracts of Bangalore, Mysore, Chitaldrug and Kadur districts, where night census was not possible owing to the nature of the country and danger of wild beasts, the final Census was taken on the morning of the 11th March. **Final enumeration.**

16. For the purpose of quickly ascertaining the totals of population, special arrangements were made for making up totals. Enumerators and supervisors met at assigned places on the morning of 11th March 1911, the returns were added up by blocks and the figures thus obtained for the smallest unit of Census operations were combined for a series of larger units, Circles, Charges, Taluks and Districts and Cities, to make up the first totals. These first totals were telegraphed by Deputy Commissioners to the Census Superintendent, Bangalore. Special arrangements had been made in the Superintendent's Office to make up and telegraph the provisional totals to the Census Commissioner for India, which was done on the 17th March 1911. According to the provisional totals, the population of the Mysore State including the Civil and Military Station, **Provisional totals.**

26. As a preliminary to slip-copying, the schedule entries were carefully examined as a check on the provisional totals. This process was commenced on the 20th March 1911 and completed on the 13th May 1911.

Examination of schedules.

27. Slip-copying was commenced on the 4th May 1911 and was completed by the end of June 1911. The average number of slips copied per day by a copyist was 264 in the first week, 683 when the work was in full swing and the general average worked up to 473. The maximum number of copyists exclusive of checkers and readers employed at one time was 310. The slips for infirms were separately written and separate slips were employed for the abstraction of entries in the Industrial Census Schedules. The slips were copied in the English language. Non-officials were paid by the job at the rate of annas two for every 100 slips correctly written up, while the officials were required to fill up not less than 400 slips per day.

Slip-copying.

28. The staff employed consisted of officials and non-officials who were formed into sections, each section consisting of one supervisor, eleven examiners, two or three attenders and two or three readers and checkers.

The staff employed.

29. The sorting of slips for the several Imperial and Provincial Tables was then commenced. It closely followed the lines indicated in the Imperial Census Procedure Code with a few alterations as explained in detail in the Code on Abstraction and Tabulation and in the Administrative Volume. The unit of sorting was the *Hobli* (or the Revenue Circle) and *Town* (Municipality) in the case of slips of the Hindu Religion and the *Taluk* (or *tahsil*) in the case of other religions. In the case of *Cities*, however, the *Division*, *Mohalla* or *Ward* was the unit of sorting. During the sorting stage, a section of establishment consisted of a supervisor, ten sorters and two attenders. A standard outturn was prescribed based on the results of previous test-sorting. The largest number of sorters employed at any one time was 220. Sorting was commenced in July 1911 and completed by the end of December 1911.

Slip-sorting.

30. The work of compilation was proceeded with concurrently with slip-sorting in the Abstraction Office and the manuscript copies of the tables were sent to the Census Superintendent's Office. The Tables were checked in the Superintendent's Office before being passed for print. The first manuscript Table completed was the Imperial Table VI on the 26th July 1911 and by the 5th March 1912 the last of the Tables was completed. Advance copies of the Tables Volume were sent to the Census Commissioner on the 25th May 1912.

Compilation.

31. The Resolution of the Government of India in the Home Department Nos. 192-208, dated the 28th June 1910, prescribed 22 Imperial Tables and two Provincial Tables of which three of the former were optional (*viz.*, XV-C and D and XVI). The Government of His Highness the Maharaja of Mysore, in their Order No. Fl. 1577—Cen. 3-10-2, dated the 24th September 1910, directed the compilation of all the Tables except that of XV-D, and the preparation of Tables IX, XII-A, XIV and XVI for all castes, tribes and races instead of for selected castes. The forms and designations of these Tables will be found in Part II—Tables.

Census Tables compiled.

32. Besides Parts I (Report) and II (Tables Volume) of the Census of India Series, (a) the Volume of Talukwar Tables, (b) the Village Population Tables and (c) the Administrative Report Volume embody the results of the Mysore Census.

Provincial Volumes.

Cost of
Census.

33. As the operations connected with the Census of 1911 are still incomplete owing to the fact that the Administrative Report and the Talukwar and the Village Population Tables have yet to be printed and issued, it may be premature to estimate the exact expenditure incurred for the Census of 1911. But the figures given below may be taken as very nearly correct for all practical purposes :—

Census, 1911				Census, 1901					
Year		Expenditure		Remarks	Year		Expenditure		Remarks
		Rs.	a.	p.			Rs.	a.	p.
1909-10	...	4,890	0	0	1899-00	...	8	0	0

					1904-05	...	3,423	0	0
Total	...	1,68,886	0	0	Total	...	1,94,924	0	0

The sum of Rs. 1,68,886 shown against the Census of 1911 includes the total of all charges actually incurred, while the expenditure of Rs. 1,94,924 shown against 1901 does not appear to include the pay of the then Director of Statistics in charge of the Census Operations. If that item be included, the expenditure will stand as: 1911—Rs. 1,68,886, 1901—Rs. 2,63,324.

From the above, it will be seen that the cost of the Census Operations will work up to 5·5 pies per head of population in 1911 as against 9·1 pies in 1901 (or 7 pies per head in 1901 if the Director's pay be excluded). It may be added that in this State, all Census expenditure is "Departmental," there being no difference between that and the "Treasury" accounts.

Acknowledgments.

34. A Census Superintendent has, from the nature of his work, to be indebted to the labours of a very large number of officials and non-officials, so that it is not possible for him to express his acknowledgments adequately to all of them. However, in the collection and tabulation of the Census Statistics and in the writing of this Report, I am under obligations to (a) the Deputy Commissioners of Districts who carried out the preliminary Census arrangements in addition to their ordinarily heavy work; (b) Mr. Mrityunjaya Iyer, Assistant, until he went on leave, for efficient help in spite of his indifferent health; and to the Assistants Messrs. Sadasiva Rao and Krishnaswami Iyengar for zealous and able co-operation; and (c) my office establishment among whom I desire specially to mention the work of Head Clerk Sitaramaiya who brought to bear in the discharge of his duties his valuable experience of the Census of 1901, and also of Venkataramaiya, Deputy Clerk. To Mr. C. H. Yates, Superintendent of the Government Press, and to Mr. D. B. Ramachandra Mudaliar, Officiating Superintendent during the absence of Mr. C. H. Yates, I desire to express my acknowledgments for their hearty co-operation in the laborious task of printing the Census forms and passing the Tables and the Report through the Press. Lastly, I am much indebted to the Hon'ble Mr. E. A. Gait, C.S.I., C.I.E., I.C.S., Census Commissioner for India, for advice and criticism at all stages of the Census Operations.

BANGALORE,
2nd September 1912.

V. R. THYAGARAJA AIYAR.

REPORT

ON THE

CENSUS OF MYSORE STATE, 1911.

CHAPTER I.

DISTRIBUTION OF THE POPULATION.

I. GENERAL DESCRIPTION.

1. Mysore is an important Native State in Southern India, and is ruled by His Highness Colonel Sir Sree Krishnaraja Wadiar Bahadur, G.C.S.I., who was invested with full powers of administration on the 8th August 1902. Mysore City is the capital, but Bangalore City is the Administrative Headquarters, where are situated the Public Offices and Archives of the State and where reside most of the principal officers of the State. Adjoining Bangalore City is the Civil and Military Station, Bangalore, a tract of 13.54 square miles assigned to the British Government for the purposes of a Civil and Military Station and administered by the Hon'ble the British Resident.

2. The State is situated between 11°36' and 15°2' North Latitude and 74°38' and 78°36' East Longitude. Its area is 29,474.82 square miles including the area of the Civil and Military Station, Bangalore. The greatest length north and south is about 230 miles, the extreme length from east to west being 290 miles. The State is nearly equal in extent to Scotland whose area is 30,405 square miles and to Bavaria whose area is 29,292 square miles.

3. The Province is surrounded on all sides by the Madras Presidency except on the north and north-west where it is bounded by the districts of Dharwar and North Kanara respectively of the Bombay Presidency and towards the south-west where Coorg adjoins it. On the eastern and western frontiers the nearest points are respectively 120 and 8 miles distant from the sea.

4. The plateau of Mysore is situated like a wedge between the Eastern and Western Ghats and the Nilgiris where the Ghats converge. The general elevation rises from about 2,000 feet above sea level along the north and south frontiers to about 3,000 feet at the central watershed which separates the basin of the Krishna to the north from that of the Cauvery to the south. Harihar in Chitaldrug District is probably the lowest point in Mysore with an elevation of 1,830 feet, Mulainagiri in the Bababudans in Kadur District with a height of 6,317 feet being the highest point.

Isolated peaks of massive rock called "drugs" form a prominent feature of the country, while chains of hills running chiefly north and south divide the tableland into numerous valleys.

5. With the exception of a few minor streams which flow on the west into the Arabian Sea, the chief rivers, viz., the Tungabhadra on the north, the Cauvery on the south and the North Pennar, the Southern Pennar and the Palar on the east, fall into the Bay of Bengal. The electric power generated from the Cauvery falls at Sivasamudram is made use of to drive the machinery in five mines on the Kolar Gold Fields and in a woollen mill in Bangalore City.

There are about 30,000 tanks in the country, of which the largest is the Marikanave lake in Chitaldrug District, recently constructed at an outlay of 44 lakhs of rupees.

**Climate,
season
and rain-
fall.**

6. The climate of Mysore, in spite of its situation within the tropics, is temperate, due chiefly to its elevation above sea level, and, notwithstanding the prevalence of fever at certain seasons, is considered generally healthy all round the year. There are no extremes of temperature, the lowest minimum averaging $51^{\circ}6$ and the highest maximum $98^{\circ}1$ in the shade at Bangalore. The absolute minimum recorded at the same station up to date is $45^{\circ}8$ and the absolute maximum $100^{\circ}8$; and this gives an absolute range of 55° . The year is divided into three seasons, the rainy, the cold, and the hot. The first commences with the bursting of the South-West Monsoon, generally in the first week of June and continues to the middle of November, closing with the rains of North-East Monsoon. The cold season, which is generally free from rain, then commences and lasts till the end of February. The hot season sets in during March and increases in intensity to the end of May and is characterized by occasional thunderstorms which sometimes produce heavy downpours. At Bangalore the mean maximum and minimum temperatures are $82^{\circ}3$ and $65^{\circ}3$ respectively for the rainy months, $82^{\circ}7$ and $59^{\circ}1$ for the cold season and $92^{\circ}2$ and $67^{\circ}7$ for the hot season. The rainfall ranges from an average of over 330 inches at Agumbe Ghat on the crest of the Western Ghats to 14 inches at Nayakanhatti in Challakere Taluk, Chitaldrug District. The zone of heavy rain, 60 inches and over, is confined to the Western Ghats region from Sorab to Manjarabad. The average rainfall in Bangalore City is 36.5 inches.

Agriculture.—

(a) Soils.

7. The soils in Mysore vary from black cotton to light sandy loam. A red-coloured loam or clay loam predominates. Differing from other soils of India, they are generally deficient in phosphoric acid. In the hilly virgin forest region in the west of the State, where coffee is largely grown, the percentage of nitrogen is very high. In the eastern portion of the State where the land has been cultivated for a long time, less nitrogen is found. The surface is generally undulating (though flat in some parts and very hilly in others), here and there broken up by rocky hills and gravelly ridges.

(b) Crops.

Rice, coffee, cardamoms, pepper, arecanut and betel-leaf are cultivated in the forest region of heavy rainfall in the extreme west; ragi, cholam, pulses, oil plants, cotton, tobacco, rice and sugarcane being grown in the other parts of the State. Among the districts, Mysore, Bangalore and Tumkur grow the most ragi, Kolar, Hassan and Chitaldrug coming next in order. Mysore and Chitaldrug have the largest area under oilseeds and grow the most tobacco. Chitaldrug is pre-eminently a cotton-growing district, and it also takes the principal lead in the limited area under wheat. Shimoga is the chief rice-growing district in the State followed by Mysore. Next in order come the districts of Hassan, Kadur, Tumkur, Kolar, Bangalore and Chitaldrug. In the Shimoga District the cultivation of rice depends on the rains alone unlike Mysore which has for this purpose a splendid system of irrigation channels. Hassan, Kolar and Shimoga are the principal sugarcane districts in the State. Tumkur stands first in the matter of garden cultivation, cocoanut and arecanut forming the chief products. Kadur and Hassan are almost exclusively coffee districts. From the proportional figures given in Subsidiary Table I of this chapter, it will be seen that ragi takes up more than one-third of the gross cultivated area, rice and grain coming next in order as regards the extent cultivated.

**Mines and
minerals.**

8. Six gold mines were at work in the Kolar Gold Fields on 1st March 1911, and of these four pay dividends. The machinery in five of these mines is driven by electric power. Manganese ore is extracted in Shimoga District, and iron ore smelted in several places in the State.

**Revenue
and ex-
penditure.**

9. The total revenue and receipts of the State for the year 1910-11 were Rs. 2,46,73,315, the total expenditure being Rs. 2,22,70,758.

**Natural
Divisions.**

10. In Mysore, there are two regions of distinct character: the hill country called the *malnad* in the West; and the open country on the East known as the *maidan*. Some of the characteristics of the *malnad* country are tersely summed up in an old Kanarese ballad of which the following is a free rendering:—

“Twelve thousand hills,
Six thousand godlings,
In every forest chaupaka,
In every village, a local chief.”

For rough purposes, the *malnad* may be regarded as identical with Hassan, Kadur and Shimoga Districts which, however, contain a few *semi-malnad* and *maidan* taluks.

11. For administrative purposes, the Province is divided into 8 districts comprising 68 taluks excluding the Jaghirs of Yelandur and Sringeri and reckoning the sub-taluks (9 in number) as parts of the taluks to which they are attached. The three districts of Shimoga, Kadur and Hassan which mostly comprise either *malnad* or *semi-malnad* taluks are shown as the Western Division in the course of this Report and the Tables referred to therein, while the five districts of Bangalore, Kolar, Tumkur, Mysore and Chitaldrug corresponding to the *maidan* portion of the Province are shown as the Eastern Division. **Administrative Divisions.**

For the purposes of the Imperial Census Code, Bangalore City, Kolar Gold Fields, Mysore City and the Civil and Military Station, Bangalore, have been classed as cities, the last alone containing more than 100,000 inhabitants and the rest being treated as cities in accordance with the discretion given to the Provincial Census Superintendent in the Imperial Code. The statistics for cities are, except where otherwise stated, given separately from the districts in which they are situated.

II. AREA, POPULATION AND DENSITY.

12. The statistics relating to area, population and density are contained in Imperial Table I, Subsidiary Tables I and II of this Chapter and in Provincial Table I. Before proceeding to discuss the statistics of districts and taluks, it will be convenient to recapitulate the main facts regarding the State and the two Natural Divisions. **Reference to Statistical Tables.**

13. The population of the Province on the 10th March 1911 was 5,806,193 persons consisting of 2,934,621 males and 2,871,572 females and was distributed into 16,831 towns and villages with 1,158,004 occupied houses. The mean density of population in the State is 197 per square mile and compares with the densities of certain Provinces in India and Europe as in the subjoined diagram. From Imperial Table I and Subsidiary Tables I and III, it will be observed that the Eastern Division which contains 67·8 per cent of the total area (excluding Civil and Military Station, Bangalore) and 74·8 per cent of the total population (excluding Civil and Military Station, Bangalore) is larger in extent and much more populous than the Western Division, and that the two divisions differ markedly from each other in several respects. (a) Analysis by Natural Divisions.

Diagram showing the Density of Population (i.e., average number of persons per square mile) in Mysore and certain other Provinces and Countries.
Scale 1" = 80 persons.

The annual rainfall in the Eastern Division averages 25·9 inches against 59 inches in the Western Division, the percentage of cultivable area to total area in the Eastern Division is 48·4 against 39·2 in the Western Division, the percentage

of gross cultivated area under rice in the Eastern Division is 7·6 against 26·3 in the Western Division, and the number of towns in the Eastern Division is 64 against 26 in the Western Division. The density per square mile is 214 in the Eastern Division against 151 in the Western Division. Similar differences between the two divisions, as regards longevity, civil condition, literacy, mother-tongue and occupations of the people are dealt with in Chapters V, VII, VIII, IX and XII respectively of the report.

(b) Analysis by Districts and Cities.

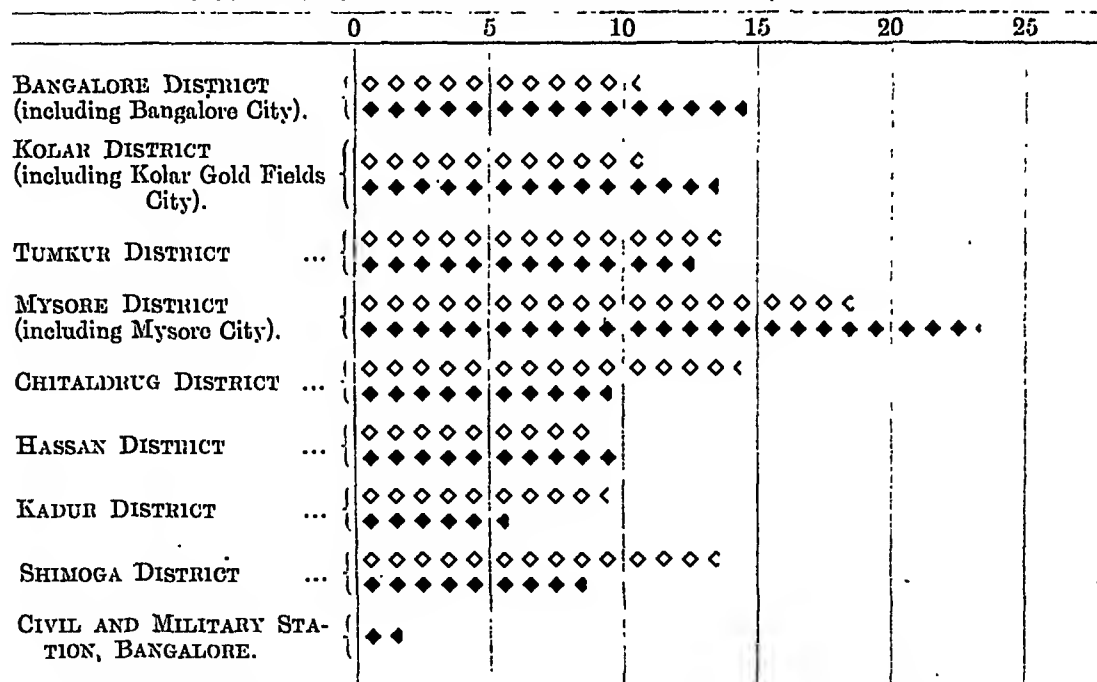

14. Of the several districts, the Mysore District has the largest area, then come Chitaldrug, Tumkur, Shimoga, Kolar, Bangalore and Kadur in the order named, Hassan taking the last place. As regards population, the Mysore District, which is the land of perennial rivers, again takes the lead followed by Bangalore, Kolar, Tumkur, Hassan and Shimoga in the order named, Kadur being the least populous.

The appended diagram shows the ratio which the area and population of each district bear to the total area and population of the State.

DIAGRAM SHOWING THE RELATION OF AREA AND POPULATION.

EACH WHITE DIAMOND REPRESENTS 1 PER CENT OF THE TOTAL AREA OF MYSORE STATE INCLUDING CIVIL AND MILITARY STATION, BANGALORE.

EACH BLACK DIAMOND REPRESENTS 1 PER CENT OF THE TOTAL POPULATION OF MYSORE STATE INCLUDING CIVIL AND MILITARY STATION, BANGALORE.

The density of population is “an abstract measure of the isolation, proximity or crowding of the population” and may in certain cases afford an index of the pressure of population on the soil. As observed in para 39 of the India Census Report of 1901, the mean density is “a mere arithmetical expression which covers an infinite variety of different conditions and is of use mainly as an arbitrary standard or line of division in relation to which a large body of figures may be grouped or arranged.”

The mean densities of population in the several districts differ from the mean density for the State, four of the districts having a mean density higher, and the other four less, than that of the State.

These facts are illustrated in the annexed map showing the densities of the several districts. Of the four districts having a higher density than the mean (197) for the Province, Bangalore District which is noted for its fertile soil and salubrious climate and is intersected by Railways radiating from Bangalore City in four directions stands first with the maximum density of 276 persons per square

mile. Then come next in order, Kolar District in which

MAP OF MYSORE.

Showing Density of Population per square mile in the several Districts.

Scale 80 miles = 1".

the irrigation under tanks has been more fully developed than in any other district and which contains the Kolar Gold Fields, Mysore District in which the river irrigation is more fully developed than in any other district, and Hassan District with its Hemavati valley and coffee industry. Of the four districts having a lower density than the mean, Kadur District which has been described as pre-eminently the *malnad* country and is the least populous, has the least density of 121 persons per square mile.

The density of population in each district will be found on analysing Subsidiary Table I to depend mainly on three factors:—

- Percentage of net cultivated area to total area.
- Percentage of cultivated area which is irrigated.
- Percentage of gross cultivated area under ragi.

In the *maidan* districts of the Eastern Division, density varies as rainfall, but this does not hold good in the case of the districts of the Western Division, where, in fact, density varies inversely as rainfall owing to the configuration of the surface.

Among cities the Civil and Military Station is the most populous but Bangalore City has the greatest density per square mile.

15. Provincial Table I will be found to give in column 12 the density in the taluks and cities of the State, the maps appended illustrating, except in the three taluks specified below, the variation of density in the taluks of the two Natural Divisions.

As regards the three taluks of Bangalore, Mysore and Bowringpet, the densities given in Provincial Table I will be found to differ from those in the second map, as the populations of the cities have in the map been taken into account while they have been omitted for calculating the density of the taluks in the Provincial Table I.

In the Eastern Division, the taluk of the highest density is the Bangalore Taluk including the City; but if the cities are excluded, T.-Narsipur Taluk heads the list with a density of 410 per square mile, Hosdurga and Hiriyur being the taluks of minimum density with 99 per square mile. In the Western Division, Arkalgud Taluk with a maximum density of 312 per square mile ranks first, the taluk of Nagar having the minimum density of 71 per square mile.

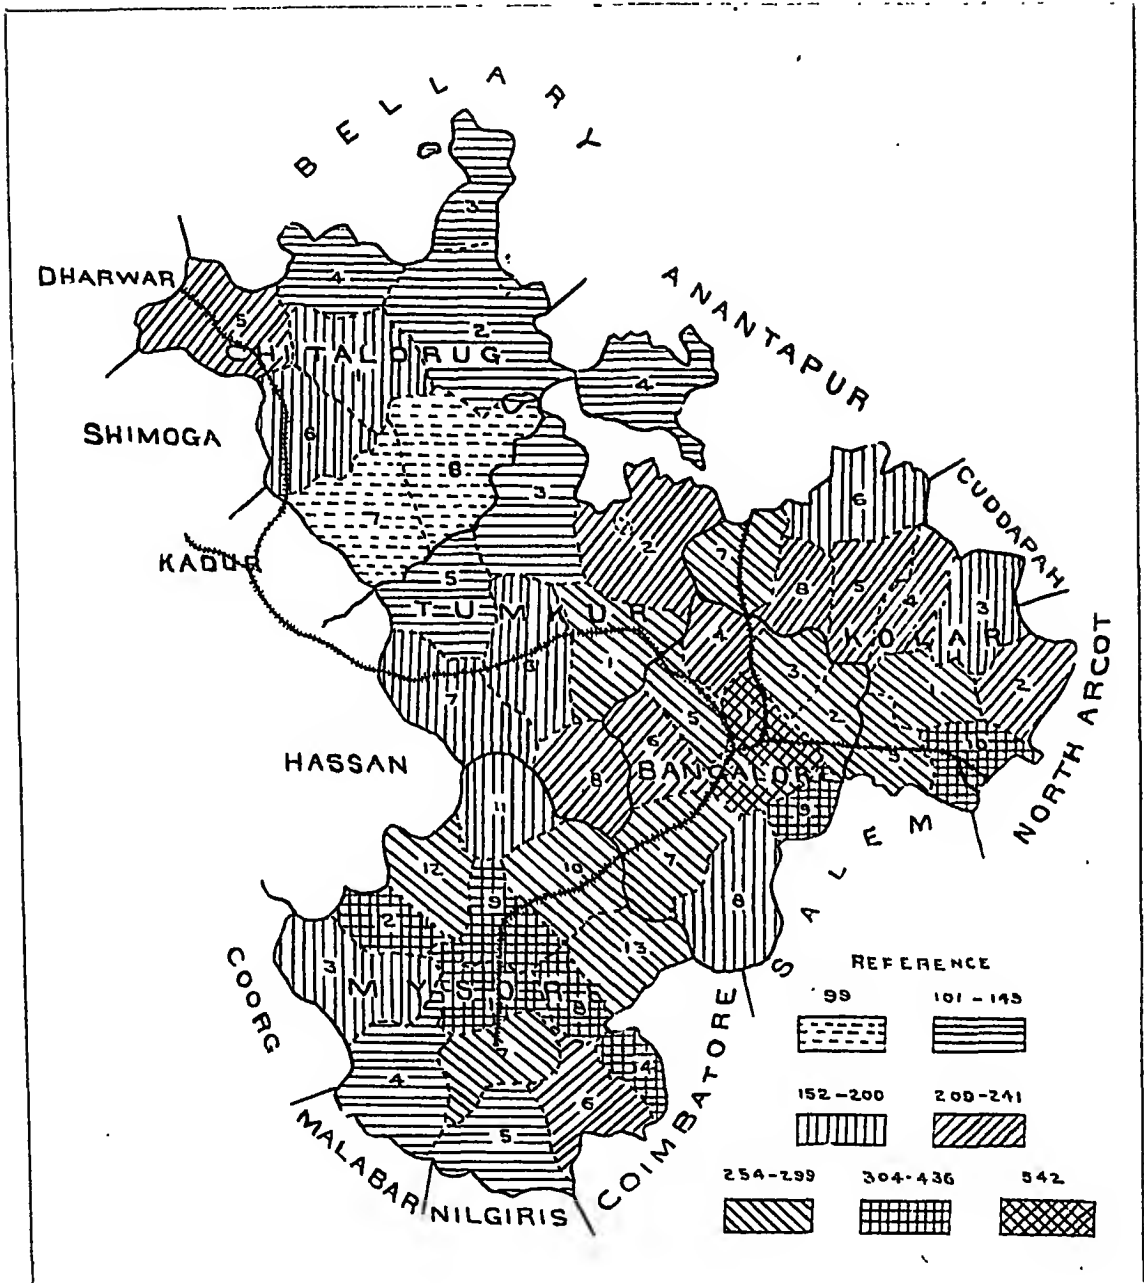

In the T.-Narsipur Taluk, the annual rainfall is moderate, but sufficient, averaging 26.5 inches, the climate is salubrious, the soil is generally good, the Canvery flowing from one end to the other, and the irrigated area being 15.7 per cent of the total occupied area. The extent of hill, forest and other unculturable land is not large, the percentage to total area being 22.5. The extent of culturable waste is also inappreciable. All these factors go to produce the high density of 410.

(c) Analysis of Density in Divisions, Districts and Taluks.

17.5 inches, the soil is stony and sterile and the extent of hill, forest and culturable waste is large exceeding 45 per cent of the total area.

In Arkalgud, the conditions are somewhat similar to those in T.-Narsipur Taluk.

In Nagar, although the annual rainfall is heavy amounting to 166.8 inches and the area under rice is 89 per cent of the total area cropped, these factors are more than counterbalanced by the existence of a large area of forest and hill forming 82.1 per cent of the total area and the unhealthiness of the climate at certain seasons of the year.

A careful study of the maps showing the density of population in the two divisions will bring out the following facts:—

1. Most of the taluks in the density scale 300-450 possess river irrigation, the rest owing their high density to either the existence of cities or superior tank irrigation.
2. Within each district and on the border between two adjoining districts, taluks in any other density scale, say 100-150, are mostly contiguous to each other, the similarity of density being due to the existence of similar features such as, soil, climate, proximity to Railways, irrigation facilities and the like.

16. We shall conclude this part of the subject with the following general remarks by Dr. H. R. Mill regarding the density of population. (Article "Geography" in the 11th edition of the Encyclopædia Britannica.)

"The population which can be permanently supported by a given area of land differs greatly according to the nature of the resources and the requirements of the people. Pastoral communities are always scattered very thinly over large areas; agricultural populations may be almost equally sparse where advanced methods of agriculture and labour-saving machinery are employed: but where a frugal people are situated on a fertile and inexhaustible soil, such as the deltas and river plains of Egypt, India and China, an enormous population may be supported on a small area. In most cases, however, a very dense population can only be maintained in regions where mineral resources have fixed

Factors influencing density of population.

the site of great manufacturing industries. The maximum density of population which a given region can support is very difficult to determine; it depends partly on the race and standard of culture of the people, partly on the nature and origin of the resources on which they depend, partly on the artificial burdens imposed and very largely on the climate."

III. TOWNS AND VILLAGES.

Statistics of Towns & Villages. 17. The statistics relating to urban and rural population are contained in Imperial Tables III, IV and V and in Subsidiary Tables III, IV, V and VI of this chapter.

Distinction between "Towns" & "Villages." 18. To understand the statistics it is necessary to differentiate between "towns" and "villages."

The definition of "town" adopted at this Census was the same as the one followed at the last Census and was as follows:—

"Town includes every Municipality of whatever size and every continuous collection of houses (if any such exists) which is not a Municipality but is permanently inhabited by not less than 5,000 persons and which the Provincial Superintendent may decide to treat as a town for Census purposes."

The definition of "Village" will be given later on; but it is sufficient to observe at this stage that villages are mostly inhabited by agriculturists and are units of Land Revenue Administration, while towns are governed under Municipal or other special laws and are in some cases centres of trade and industry.

There are 90 municipalities in the State including the Civil and Military Station, Bangalore, against 125 in 1901: of these, three, *i.e.*, Bangalore City, Mysore City and the Civil and Military Station, Bangalore, have been treated as cities.

The Kolar Gold Fields tract, which is not a municipality but is a Sanitary Board Area governed by a special Regulation, has also been classed as a city.

The decline in the number of municipalities from 125 in 1901 to 90 in 1911 is due to the passing of a Municipal Regulation in 1906 under which a reclassification of municipalities has been effected. The number of municipalities in 1891 and 1881 was 99 and 84 respectively, including the Civil and Military Station, Bangalore.

In the whole State there are only two villages each with a population of more than 5,000. Robertsonpet in Kolar District and Turuvannur in the Chitaldrug District; but it has not been considered necessary to class them as towns. It may be interesting to record the fact that in 1901 there were two such villages, Belakvadi and Agara in Mysore District, and that they have not maintained the same population at this Census.

21. We shall now proceed to trace the variation of urban population in each division. Variation of population in Towns.

1. EASTERN DIVISION.

There are 64 towns in this division inclusive of three cities and excluding the Civil and Military Station, Bangalore. All the three cities show increases of population during the decade. Bangalore City possesses excellent water-supply, drainage and lighting systems, is a railway centre and contains two mills besides other industrial concerns. Its population fell from 80,285 in 1891 to 69,447 in 1901 owing to the ravages of plague, but has now regained the normal strength. The increase of 27·3 per cent in the population of the Kolar Gold Fields during the intercensal period is an indication of the prosperity of the gold mining industry. It was during this decade (*i.e.*, in June 1902) that the industry received an impetus by the substitution for steam power driving the machinery, of the cheaper electric power generated from the Canvey falls at Sivasamudram. In the Mysore City the increase (4·7 per cent) is moderate and is due to the operations of the Mysore City Improvement Trust Board during the decade; but the population is still less than what it was in 1891.

Each of the districts comprising the division will now be dealt with in turn:—

There are twelve towns (excluding Bangalore City) in this district and most of them have suffered a loss of population during the decennium. Nela- (a.) Ban-
galore
District.
mangala, Tyamagondlu, Channapatna, Closepet, Kankanahalli and Anekal were more or less infected with plague on the date of final Census and many persons were living in sheds outside the towns. Hoskote has partly regained the population which it had lost in 1901 but its population has not yet come up to what it was in 1891.

Of the 11 towns in the district (excluding Kolar Gold Fields), 8 towns show an increase of population. The decrease of population in Kolar and Mulbagal is due to the prevalence of plague in them and their partial evacuation on the date of the Census. Although Chikballapur shows a large increase of population during the decennium, it has not yet regained the population which it had in 1891 and of which it lost nearly half in 1901 owing to plague. The decrease in Sidlaghatta is due to the recrudescence of plague in it several times during the intercensal period. (a.) Kolar
District.

Of the 10 towns in the district, 4, *i.e.*, Sira, Maddagiri, Koratagere and Turn- (a.) Tum-
kur Dis-
trict.
vekere, show an increase of population during the decade, the rest showing a decrease. Tumkur, Gubbi, Tiptur and Knnigal were partially evacuated on the date of the final enumeration owing to the outbreak of plague in them. The frequent appearance of plague in Chiknayakanhalli during the decade has led to a diminution of its population.

Of the 19 towns in this district (excluding Mysore City), 9, *i.e.*, (1) Nanjan- (a.) My-
sore Dis-
trict.
gnd, (2) Chamrajnagar, (3) Gundlupet, (4) Talkad, (5) T.-Narsipur, (6) Nagaman-
gala, (7) Saligrani, (8) Krishnarajpete and (9) Heggaddevankote, show an increase of population during the decade, the rest showing a decrease. The decreases are specially heavy in (1) Seringapatam, (2) Malvalli, (3) Hunsur, and (4) Yedatore. Plague and malaria account for the decrease in Seringapatam and Yedatore, while a falling birth-rate and an increasing death-rate due to the prevalence of plague explain the decreases in other towns.

Of the 9 towns in this district, 6, *viz.*, (1) Chitaldrug, (2) Holalkere, (3) Jaga- (a.) Chital-
drug Dis-
trict.
lur, (4) Molakalmuru, (5) Hiriur and (6) Challakere show an increase of population. The decreases in Davangere, Harihar and Hosdurga are accounted for by the prevalence of plague in them at the time of Censuses.

Davangere is an important seat of trade and there has been a steady increase of population in it from 1881 to 1901.

2. WESTERN DIVISION.

There are no cities in this division. Of the 8 towns in the Hassan District, (b.) Has-
san Dis-
trict.
3, *i.e.*, (1) Hole-Narsipur, (2) Arkalgud and (3) Arsikere, show an increase of population, the rest showing a decrease. The prevalence of plague at the time of

Census accounts for the decrease in Hassan, Alur and Saklespur during the decade, an excess of deaths over births explaining the decrease in Belur and Alur.

(b.) Kadur District.

In Kadur District only Sringeri and Koppa show an increase while the other six towns show a decrease. Plague accounts for the decrease in Chikmagalur, while the decrease in the other towns is mostly due to an excess of deaths over births during the decade.

(b.) Shimoga District.

Of the 10 towns in Shimoga District, 5, viz., (1) Shimoga, (2) Sagar, (3) Tirahalli, (4) Sorab and (5) Kallurkatte, show an increase of population, the rest showing a decrease.

The decline of population in Nyanti, Kumsi and Honnali is due to the prevalence of plague therein and their partial evacuation at the time of Census. In Channagiri, some people have settled beyond the limits of the town owing to the recrudescence of plague.

Distribution and growth of population in Towns classified according to size.

22. Subsidiary Tables V and VI will be found to give full details on this subject. Of the 91 towns, one (Civil and Military Station, Bangalore) contains a population exceeding 100,000, two (Bangalore and Mysore Cities) contain populations ranging between 50,000 and 100,000, one (Kolar Gold Fields) has a population of from 20,000 to 50,000 and two (Shimoga and Davangere) have populations varying between 10,000 and 20,000, the rest belonging to other classes.

The number of females per 1,000 males is lowest in Kolar Gold Fields (739 per 1,000 males) which among cities has the largest number of foreign born (851 per mille) and is highest in towns whose population lies between 5,000 and 10,000 (985 per 1,000 males). The increase of population during the past decade has been greatest in Kolar Gold Fields; the percentages of increase 27·3 and 439·2 in the two decades 1901 to 1911 and 1891 to 1901 respectively being an eloquent testimony to the romantic growth of the Gold Mining industry. The comparative and absolute increases of 16·6 per cent and 92·2 per cent respectively over the total urban population of 1871, record the growth in urban conditions in the State during the past 40 years. The negative percentages in columns 5 and 6 of Subsidiary Table V are indicative of the havoc wrought by plague in certain towns since 1898 and of the rise and fall of towns from one class to another.

Distribution of population between Towns and Country.

23. Subsidiary Table III embodies the necessary details under this head, and the accompanying diagram shows the urban and rural population in each district. Out of every thousand persons in the State 113 reside in towns, the number for Eastern and Western Divisions being 108 and 68 respectively. On analysing by districts, it will be seen that Kadur District shows the largest number per mille residing in towns (90 per mille), Hassan District giving the least (53 per mille). 11·3 per cent of the total population reside in towns, 88·7 of the total population residing in villages.

In 1901, the corresponding percentages were 13 and 87 respectively, and the comparison shows that there has been a slight decrease of the population in the towns during the decade. This decrease is due to the decline in the number of towns during the decade—explained elsewhere—and to the prevalence of plague at certain seasons in many of the towns, leading to the movement of the urban population into villages. From Subsidiary Table III, it is apparent that of the urban population 47 per cent live in towns with a population of 20,000 and over, 20·4 per cent live in towns with a population of from 5,000 to 10,000, and 29·1 per cent reside in towns with a population of under 5,000. Of the rural population, 53·5 per cent live in villages with a population of under 500, 42·3 per cent living in villages with a population of from 500 to 2,000.

24. In England and Wales, 78 per cent of the population live in towns and only 22 per cent live in villages; in Scotland and Ireland, the urban population forms 69·8 per cent and 31 per cent respectively of the total population. In Baroda State the urban population forms 19·9 per cent of the total population, the corresponding percentages for Madras and Bombay Presidencies (including States) being 11·7 and 18·1 respectively. **Comparison with Provinces in Europe and India.**

25. Readers of Mr. Baden Powell's and Sir T. Morison's works are familiar with the detailed descriptions of the types of Indian Village and the Village Community from the Administrative and Economic points of view respectively. This chapter is, however, concerned with villages as containing aggregates of population, and the barest outlines will therefore suffice. **Definition of "Village."**

In the Provincial Census Code, village was thus defined as in 1901:—

"Village" means the area constituted into a village by the Revenue Survey Department and includes all land belonging to such village and all hamlets, if any, (*i.e.*, groups of houses called by different names) formed within such area. In the case of some alienated tracts (Inam and Kayamgutta villages) to which the Survey operations have not been extended, the term 'village' shall refer to the 'asli' or parent village and include all hamlets which are subordinate thereto without forming independent units for revenue purposes.

It includes 'Bechirakh,' 'Amanikere,' 'Nalahanta,' 'Coffee Estate,' 'Kavals,' separately measured and mapped and other units of Revenue Administration, though they may contain no or but a few permanent human habitations."

A description of the powers and duties of the village officials (patel, shanbhog, etc.), will be found in paras 1 to 6 of Chapter IV of the Mysore Revenue Manual.

26. In the *maidan*, the village site forms a distinct and generally the central portion of the village and is surrounded by the cultivated and waste lands of the village. Each village site ordinarily contains the "Holgeri" where the depressed classes live. To every large house in the village site is annexed a 'hittal' or backyard. **Village sites.**

In the *malnad*, villages are often such only in name, being composed of scattered homesteads at various distances apart. Every large village whether in the *maidan* or *malnad* usually contains a temple, an irrigation tank and a village *chavadi*.

The mean distance between adjacent villages in the State varies from 1·13 mile in Kolar District to 1·97 in Chitaldrug District, the mean for the State being 1·43 mile.

27. The average area per village in the Eastern Division is 1·46 square mile, against 1·66 square mile in the Western Division, the average for the whole State being 1·52 square mile. The average area per village in the districts varies from ·92 square mile in Kolar District to 2·77 square miles in Chitaldrug District. **Average area and population per village in the Natural Divisions.**

The average population per village in the Eastern Division is 326 against 265 in the Western Division, the average for the whole State being 308.

The average population per village in the districts varies from 435 in Mysore District to 239 in Hassan and Kolar Districts.

28. From Imperial Table III combined with Subsidiary Table V, it will be seen that there are 13,999 villages, each with a population of under 500; 2,097 villages each with a population of between 500 and 1,000; 561 villages with a population of between 1,000 and 2,000; 81 villages with a population of between 2,000 and 5,000. About 47 per cent of the total population live in villages with **Villages classified according to population.**

* For a description, from an economic point of view, of an ordinary village in Mysore, see Chapter XII of this Report.

a population below 500, villages with a population of from 500 to 1,000 accounting for about 25 per cent of the total population and villages with a population ranging between 1,000 and 2,000 containing 13 per cent of the population.

IV. HOUSES AND FAMILIES.

Descriptions of dwellings: Definition of "House" etc.

29. Imperial Table I, Subsidiary Table VII and Provincial Table I will be found to give details of occupied houses and house-room.

The dwellings of the people are generally of mud, one-storeyed and with few openings outwards except the door but possessed of courtyards within, surrounded with verandahs and open to the sky. In the better class of houses, these are well paved and drained, while the wooden pillars are elaborately carved or painted. The cattle are generally tied in a separate part of the house and occasionally in separate sheds. The huts of the Holeyas, Madigas and other lower classes are thatched; but the houses of the higher classes are covered with either terraced or tiled roofs, the latter more especially in the *malnad* where the rainfall is heavy. In the *malnad*, the dwelling houses are few and far between. Since the appearance of plague in the State in 1898 great attention has been paid to the opening out of extensions in congested areas and to the erection of sanitary dwellings.

The definition of 'House' adopted at the present Census was the same as the one followed in 1901 and ran thus:—

"A dwelling house is defined to be the dwelling place of one or more families with their resident servants having a separate principal entrance from the common way. The common way, it must be remembered, is not necessarily a public way.

* * * Under such circumstances, the subordinate tenements should be separately numbered, the series being also painted on the main entrance to ensure that none of the subordinate tenements is overlooked."

According to the definition, the occupied house is synonymous with the tenement occupied by a family. Mills, factories, bar and silledar lines, jails, schools, plantations containing houses, mutts, nakans, temples, shops, chat-trams, dharmasalas, travellers' bungalows, enclosed cart-stands, temporary sheds for accommodation of coolies, etc., were also numbered in the same way as houses. The total number of houses thus censused in the State was 1,509,265, the ratio borne by the number of occupied houses to the total number of houses censused being 76·7 per cent. In the Civil and Military Station, Bangalore, the houses were numbered in accordance with the instructions issued by the Superintendent of Census Operations, Madras Presidency. These differed from the above in the direction that one number should be given to a house even though two or more families were living in different rooms of the same house. This difference must be borne in mind whenever the figures for Civil and Military Station, Bangalore, come under examination.

Number of occupied houses per square mile.

30. The average number of occupied houses per square mile in the State has increased from 38 in 1901 to 39 in the present Census and may be accepted as a proof of growth in the number of houses in the extensions and elsewhere during the past decade. The increase in the average from 1881 has been steady. In the Western Division, however, the number of houses per square mile has fallen from 31 in 1901 to 30 in the present Census, while in the Eastern Division the number has increased from 40 in 1901 to 43 in 1911.

On reviewing by districts and cities, it will be seen that the average number of houses per square mile has increased in all the districts and cities of the Eastern Division except Mysore City, that it has remained stationary in the Hassan and Shimoga Districts and that it has decreased by one in Kadur District and by 255 in the Civil and Military Station, Bangalore.

The average number of houses per square mile in each district corresponds approximately with the density of population in each district.

Number of persons per house or average size of families.

31. The average number of persons per house in the State is 5 and has remained stationary since 1901.

On analysing by districts and cities, the average will be found to have increased from 5 to 6 in the Civil and Military Station, Bangalore, while in the Kolar Gold Fields, it has decreased from 5 to 4. Elsewhere the average has remained stationary.

The above facts lead to the conclusion that the increase in the number of houses has kept pace with the increase of population during the decade and that there is generally little or no overcrowding except perhaps in parts of the four cities. It is remarkable that the average number of persons per house in the State is very nearly the same as in Ireland for 1911 (5.1) and in England and Wales for 1901 (5.19). This identity of averages is not, of course, indicative of similarity in the urban and rural conditions of the countries compared.

. Among the Hindus who form the bulk of the population in the State, the Joint Family System is the rule and all the coparceners generally live in the same house. The partition generally takes place on the death of the parents but may be deferred in exceptional cases. The size of the family varies generally with the caste or tribe and with their material condition.

The number of married women of fifteen years and upwards in the State is 1,126,379 (*vide* Imperial Table VII). If every one of these married women had a separate house, the number of occupied houses would be 1,126,379, it being assumed that the married women at age-period 0-15 would live with their parents or parents-in-law. As a matter of fact, the number of occupied houses in the State is 1,158,004 or 1,028.1 per 1,000 married women.

CHAPTER II.

MOVEMENT OF POPULATION.

32. The preceding chapter dealt with the population as it stood on 10th March 1911, and except in the case of the population of towns did not deal with the variation during the decade. This chapter will treat primarily of the growth of population in districts and taluks during the decennium and secondarily of the variation from 1871. Scope of the chapter.

33. The statistics referred to in this chapter are contained in Imperial Table II, Provincial Tables I and II and the Subsidiary Tables of this chapter as noted below :— Reference to statistics.

- I. Variation in relation to Density since 1871.
- II. Variation in Natural Population.
- III. Comparison with Vital Statistics.
- IV-A. Variation by Taluks classified according to Density (Actual Variation).
- IV-B. Variation by Taluks classified according to Density (Proportional Variation).

Reference is also made to agricultural and other statistics where necessary.

34. The following extract from the Mysore Census Report, 1881, summarises the History from 1761 to 1799 :— Historical Note regarding the population in early times.

“During the Muhammadan usurpation under Haidar Ali and Tippu Sultan which lasted from 1761 to 1799, unceasing warfare not only kept the whole country in continual turmoil but also led to a great intermingling of various classes in the population. A strong Mahratta element had been introduced into the northern and eastern districts by the settlements of the Bijapur State during the 17th century, and these had been followed by the Mughal Government of Sirā. Subsequently, even after the Mysore Rajas had established their power, large tracts in the centre of the country were pledged to the Mahrattas to buy off their repeated invasions. Migrations of the people *en masse* from a district threatened with such incursions were so frequent that a special word, *Falsé* came into use to describe these fugitives. But under Haidar, wholesale transportations of population took place. In 1766, after the conquest of Malabar, 15,000 Nairs were deported to the less populous parts of Mysore, though only 200 are said to have survived. Large numbers of Coorgs were forcibly converted and removed to Seringapatam, of whom 10,000 made their escape on the night of Tippu's defeat by the British in February 1792. On Haidar's invasion of the Carnatic in 1780, when the district of Tanjore was ravaged, all the weavers and their families of that part were collected and driven to Seringapatam to people the Island. The population of Sirā was bodily transferred to the same place to furnish inhabitants for the suburb of Ganjam, while large numbers of Bedar youth, forcibly converted to Islam, were formed into the effective *Chela* battalions of his army.”

Information regarding the extent to which the Province was inhabited from 1799 to 1871 is scanty and based on conjectural estimates. In his report dated 5th December 1804, Col. Wilks estimated the population at 2,171,754 persons while in 1833, according to Col. Morrison's estimate, the population was 4,500,000 persons. In the Khaneshumari estimates of 1841, 1851, 1860 and 1869-70, the population was returned at 3,050,713, 3,426,458, 3,821,000 and 4,108,607 persons respectively.

35. The results of the several Censuses and the rates of increase from one Census to the succeeding Census, are shown in the appended table :— Results of the several Censuses.

Year of Census				Population	Increase (+) or decrease (−) per cent
1871	5,055,402
1881	4,186,188	−17.2
1891	4,943,604	+18.1
1901	5,539,399	+12.1
1911	5,806,193	+4.8

The percentage of net variation during the 40 years (1871-1911) is 14.9 for the whole State. The State has received no accession of territory since 1871. The mean density of population per square mile has steadily increased from 142 in 1881 to 197 in 1911. The increase in the *natural* population during the decade as distinguished from the *actual* population is 5 per cent (*vide* Subsidiary Table II).

Factors affecting growth of population.

36. As the increase of population during a decennium is the combined effect of two factors, one being the excess of births over deaths and the other being the balance between immigration to and emigration from the country, it will be convenient to describe the machinery for the registration of Vital Statistics and of the statistics of migration.

Registration of Vital Statistics.

(a) Registration in urban areas.

37. Section 48 (1) (g) of the Municipal Regulation, No. VII of 1906, authorises the Municipal Council to make bye-laws for the registration of births, deaths and marriages. The following extract from the Government Proceedings, dated the 18th May 1911, No. 9484-50—Ml. 120-10-49, reviews the progress made by the Municipalities in this direction until the close of the year 1909-10 :—

"In the Bangalore and Mysore Cities, special establishments for the registration of vital statistics were maintained at a cost of Rs. 4,566. In the other Municipalities this work was done generally by the patel except in Shimoga and Sringeri where it was done by the Municipal staff. The report of births and deaths was obligatory under the bye-laws in force. In the Mysore City, bye-laws were framed for the compulsory report of births and deaths and they were sanctioned by Government during the year. In the Chikmagalur Town, the framing of the necessary bye-laws was under the consideration of the Municipal Council. * * * The report of births in the Bangalore City is stated to be not satisfactory as the public in general are still ignorant of the bye-laws. * * * Seven cases were prosecuted for failure to make a report in time of births and deaths in the Bangalore City. In four cases the accused were convicted and fined Rs. 2-4-0. The remaining three cases were pending at the close of the year."

(b) Registration in rural areas.

38. In rural areas the registration of births and deaths is done by the patel of the village under the supervision and control of the Revenue Officers and the results are compiled and forwarded to the Sanitary Commissioner. Revenue Officers on tour and particularly on jamabandi duty are enjoined by the standing Orders of Government to check the registers written by the patel. As the patel is sometimes illiterate, he writes the register with the help of the shambhog or some other person.

(c) Registration of Migration.

39. No machinery exists at present for recording the volume of emigration from and immigration to the Province each year and the only information available on the subject has to be obtained from the Census figures of the decades as shown in para 40 below.

Analysis of the growth of population by reference to Vital Statistics and Migration.

40. From Subsidiary Table III, it appears that the deficiency of births over deaths during the decade has aggregated 144,519 and that there has been no natural rate of increase during the period.

Subsidiary Table II shows that the immigrants have increased from 306,381 in 1901 to 312,908 in 1911 and that the emigrants have similarly increased from 132,342 in 1901 to 139,453 in 1911.

As pointed out in para 123 of the India Census Report, 1901, the real migration during the period is not measured by the difference in numbers between the two sets of statistics. The details of the working are given below :—

Immigrants in 1901	306,381
Do in 1911	312,908
				2)	619,289
				Mean	309,645
Mortality at 40 per mille per annum for 10 years 2/5 of 309,645, i.e.	123,858
Census increase in Immigrants from 1901 to 1911	6,527
Probable number of actual Immigrants in the decade	130,385
Emigrants in 1901	132,342
Do in 1911	139,452*
				2)	271,794
				Mean	135,897
Mortality in the decade 2/5 of 135,897, i.e.	54,359
Census increase in emigrants	7,110
Probable number of actual emigrants in the decade	61,469

Adopting the method described in the same para, we get 68,916 as the balance between immigration and emigration during the period. According to the Subsidiary Tables II and III interpreted in the light of the above method we ought to expect a net loss of 75,603 persons in the population of 1901. As the

* Since reported to be 139,574 as given in Subsidiary Table II.

Census figures of 1911 indicate an increase of 4·8 per cent over the population of 1901, and as there is no reason to doubt the approximate accuracy of the figure giving the balance between immigration and emigration, it is clear that the registration of vital statistics during the decade, as summarised in Subsidiary Table III, has been defective. That the inaccuracy in the registration of vital statistics is not peculiar to Mysore but is shared by all Provinces in British India, will appear from the following remarks of Mr. Hardy, in para 49 of his Memorandum on the Age Tables and Rates of Mortality of 1901:—

"It would appear hopeless for many years to come to expect anything like complete registration of births and deaths in India and I would suggest that it would be well to concentrate efforts in this direction upon certain small but representative areas in various parts of India."

41. The inaccuracy of the registration of births may be proved from another set of considerations. According to Imperial Table VII of the Mysore Census of 1901, the number of married women at age 15-50 in the State including Civil and Military Station, Bangalore, was 882,711. From the Table of fecundity given at page 64 of Newsholme's Vital Statistics, the least number of births per 1,000 married women at age period 15-50 per annum is 173, and the average number of births in Europe is stated to be 250 in the Chapter on Public Health and Vital Statistics in Volume I of the Imperial Gazetteer (page 507). Correlation between recorded births and fecundity.

Taking the smaller figure, the least number of births should have been 152,709 for each year of the decade from 1901 to 1910; but the average annual number of births according to the Subsidiary Table III is 94,467. The birth-rate as thus returned is therefore impossibly low.

42. Although the Vital Statistics as summarised in Subsidiary Table III, have failed to throw light on the growth of population during the decade, it is desirable to seek for an explanation in the conditions affecting births, deaths and migration. As observed at page 509 (Chapter X, Public Health and Vital Statistics) of Volume I, Imperial Gazetteer, Review of the conditions of the decade.

"Nothing is clearer than the effects of marked abundance of food or the reverse upon the general state of the public health and of both food and health upon the birth-rate. With any marked rise or fall in food prices there is immediately a similar movement in the death-rate and an opposite movement in the birth-rate 9 months later. When famine prevails and subsequently other factors co-operate, marriages are deferred and the able-bodied leave their homes in search of work or relief. With the recurrence of the first bountiful harvest the tide turns, deferred marriages are celebrated, cohabitation is resumed and the sexual instinct, depressed by privation, resumes its sway fortified by rest and by comparatively abundant food. The death-rate now falls rapidly to below the normal owing to the previous elimination of the physically weakest; and nine months later the birth-rate (calculated on the total population which now contains a larger proportion of persons at the reproductive ages) rises with a bound and is maintained above the normal, generally for about a year when the ordinary relations of the rates are resumed."

The conditions of the decade will, therefore, be described under the following heads:—

- (a₁) Conditions of Season and Agricultural prospects.
- (a₂) State of Public Health.
- (a₃) Extension of Irrigation.
- (a₄) Improvement of Communications and Construction of Civil Buildings.
- (a₅) Development of Agriculture.
- (a₆) Industrial Progress.

43. Average rainfall, 38·56 inches, i.e., 2·36 more than the average for 30 years since 1870. Harvests were good and there was a sufficient supply of water and fodder for cattle. There was an increase in the area under cultivation. The prices of food grains were somewhat easier than during the previous year. (a₁) Season and agricultural prospects. 1901-02. 1902-03.

Rainfall, 42·49 inches. Agricultural conditions were very satisfactory and the prices of food grains declined considerably. There was a large increase both in the area of lands under crops and of lands under occupation.

Rainfall, 55·49 inches. The year was memorable owing to the disastrous effects of the torrential rain in the Kolar District, sweeping away nearly the whole of the famous Palar series of tanks. The year was otherwise favourable. There was an increase in the extent of lands under occupation. 1903-04.

- 1904-05.** Average rainfall, 29·16 inches. The year was unfavourable to agricultural operations. There was a drought, particularly in the Kolar District, where cattle suffered more than men, and all possible measures were adopted for the relief of both men and cattle.
- 1905-06.** Rainfall, 26·67 inches. The year was one of considerable anxiety. The crops suffered considerably owing to the general failure of the rains, and there was a rapid rise in the prices of food grains. Cattle also suffered much for want of fodder and water. All possible measures were adopted for the relief of men and cattle.
- 1906-07.** Rainfall, 44·44 inches. The agricultural prospects were favourable and enabled the people to recover from the depressing effects of the previous two lean years.
- 1907-08.** Average rainfall, 38·97 inches. Though above the average for the 37 years, it was not evenly distributed and there was a partial failure of the usual October rains. The outturn of crops during the year perceptibly declined and the prices of food grains rose slightly higher.
- 1908-09.** Rainfall, 35·17 inches. Distress prevailed considerably and the prices of food grains ruled high. Owing to lack of sufficient local employment a larger number of people than usual emigrated from Mysore and Tumkur Districts to Nilgiris, Wynad and other parts in search of labour.
- 1909-10.** Rainfall, 38·22 inches. Agricultural depression disappeared and the people were generally prosperous. The prices of food grains fell slightly.
- 1910-11.** Rainfall, 48·18 inches. The outturn of crops was good and the prices of food grains fell to some extent.

(a.) State of public health. 44. Plague was virulent during the years from 1901-02 to 1904-05 and in 1907-08 and 1910-11, but was mild during the years 1905-06, 1906-07, 1908-09, and 1909-10. Inoculation against plague was, during the later years of the decennium, popularised as a preventive measure and the disease has lost much of its virulence. Vaccination as a preventive against small-pox was, by Regulation No. I of 1906, made compulsory in Bangalore and Mysore Cities and Kolar Gold Fields. Subsequently, in 1909-10, this system was introduced into several Municipal Towns in the Bangalore, Kolar, Kadur, Shimoga and Chitaldrug Districts.

In August 1907, the Department of Public Health was constituted in the State with a properly equipped staff for successfully combating plague, cholera and other epidemics. The staff consists of a Sanitary Commissioner and other officers. Advisory Sanitary Boards have also been constituted, a Central Sanitary Board for the whole State and District Sanitary Boards for each district.

(a.) Extension of irrigation. 45. The decade is memorable as having seen the completion of big irrigation works in the State. The Marikanave Reservoir which was progressing at the commencement of the decade was practically completed in 1907-08, and the restoration of tanks in the Palar Series in the Kolar District which were swept away by the heavy rains of 1903-04, was also completed in 1905-06.

In January 1902, the members of the Irrigation Commission visited Bangalore and a Conference was held in the Public Offices.

(a.) Civil buildings. 46. The chief among the public buildings undertaken and completed or nearing completion during the decade were the Maharaja's Palace at Mysore, the Victoria Hospital at Bangalore and the buildings in connection with Tata's Indian Institute of Science at Bangalore.

Improvement of communications. The principal works undertaken and completed during the decennium were the widening and extension of the Bababudan Hill roads, the opening out of the Saklespur-Gonibid road, the extension of the Sagar-Malnad roads and the bridging of the difficult river-crossings of the Cauvery at Yedatore, of the Hemavati at Hole-Narsipur, of the Bhadra at Tadasa and of the Lokapavani at Hannakere. In 1907, the Steam Tramway Line was opened from the Shimoga Railway Station to the Manganese Mines at Kumsi. The total length of the roads maintained during the decade was 1,968 miles from Provincial and 3,502 miles from District Funds as against 1,921 miles from Provincial and 3,416 miles from District Funds in the previous decennium.

(a.) Development of agriculture. 47. An Agricultural Chemical Laboratory was established in the State in 1901-02; attention was directed to improve cotton cultivation by the introduction

of the choice foreign varieties of seed, to plant new fruit trees, and to grow coffee in the plains. Considerable attention was also paid to the cultivation of rubber in the State; an Experimental Farm was opened at Hebbal, and a start was given to the imparting of instruction in sericulture at the Tata's Silk Farm at Bangalore.

The Co-operative Societies Regulation (III of 1905) was passed in 1905 and good progress was made during the decennium in regard to co-operative movements. The number of Co-operative Societies working at the close of the decade was 111 with a total membership of 9,043, and a share capital of Rs. 2,31,486.

The holding of several Industrial and Agricultural Exhibitions and of cattle shows in several parts of the State in connection with the jattras or fairs on the occasion of religious festivals, was another noteworthy feature of the decade, these exhibitions and shows having an educative value to the local raiyats in raising different varieties of grains and fruits as also in the breeding of strong agricultural bullocks.

48. An appreciable progress was made in the Industrial movements in the State by the establishment of no less than 20 Industrial and Weaving Schools, both Government and private. Of the aided institutions, the one at Hassan, *viz.*, the Wesleyan Mission Orphanage Industrial School, was mainly for the education of girls. A scheme for working the pottery and the tiles branch at the Government Industrial School, Mysore, was started at the close of the decade thus giving an impetus to the art of pottery and tile making in the State out of choice *terracotta*.

(a). Industrial progress.

The starting of the Economic Conference at the close of the decade for the furtherance of the Industrial, Agricultural and Educational enterprises and to bring to full development the natural resources of the State marks an epoch in the Economic History of Mysore.

49. A brief account of the principal industries in each district, extracted from page 34 of the Mysore General Administration Report for 1910-11 and the industrial Census schedules, is given below:--

State of the industries in each district.

- (1) *Bangalore District.*—The Mysore Spinning and Manufacturing Company and the Bangalore Woollen, Cotton and Silk Mills are in a flourishing condition. The Tata's Silk Filature Company under the management of the Salvation Army continued to work and produced silk worth Rs. 4,587. The Iron and Brass Foundry of Mackenzie & Company and the Ripon Iron Works manufactured articles of the value of Rs. 26,200. The Brick and Tile Works of Bangalore City and the Government Military Dairy Farm in Bangalore Taluk, continued to show steady progress.

The Lakshmi Dye Works and the Mavalli Dye Works turned out Rs. 19,000 worth of goods.

The Cigar Factory, the Mysore Tannery Limited, the Aryan Hosiery Factory and the two tanneries at Thattekere in the Channarayana Taluk were doing good business during the year.

The Sugarcane Mill of Mr. Krishna Iyengar at Urgahalli and the two Sugar Factories at Agaram and Kayamgutta Kundalahalli are working satisfactorily.

- (2) *Kolar District.*—The Electric Saw Mills at Bowringpet and the Cigarette Factory at the same place have continued to yield good profit. The Sugar Factory at Goribidnur turned out 800 tons of sugar worth Rs. 1,44,000. The output at the Kolar Gold Mines continued normal, the number of persons employed being 25,303.

Skins to the value of Rs. 15,000 were tanned at the tannery near Chikballapur.

- (3) *Tumkur District.*—The Paddy Husking Mill at Tumkur worked for only two months. The Wesleyan Mission Industrial School at Tumkur turned out good work during the year.

- (4) *Mysore District.*—The Coffee Curing and Bone Crushing Industries of Hunsur and the Weaving Factory started by Mr. B. S. Krishna Iyengar at Mysore are working satisfactorily.

The Rice Mill at Yedatore did not turn out much work during the latter part of the year. The Government Industrial School at Mysore continued to show good progress in all its branches.

- (5) *Hassan District*.—The well-known Brass and Copper Industry at Sravanabelagola was in a flourishing condition and weaving was largely carried on in Hole-Narsipur.

The Factories for the manufacture of tiles of Mangalore pattern at Saklespur and Harihalli in the Manjarabad Taluk are working satisfactorily. There were 77 coffee and 5 cardamom plantations in the district, the business in most of them being normal.

- (6) *Shimoga District*.—At Yelagalale in the Sagar Taluk, a factory named "Sarada Tile Works" has been started for the manufacture of Mangalore tiles. The tram-way works and the Manganese Mines in the District were not thriving.

The Gudigars of Sagar and Sorab, engaged in sandalwood and ivory carving, are declining owing to insufficient demand for such articles.

- (7) *Kadur District*.—A factory for the manufacture of flooring and roofing tiles after the Mangalore pattern is reported to have been started at Sringeri. The 163 coffee, 4 cardamom and 3 rubber plantations in the district employed 19,127 persons on 10th March 1911.

- (8) *Chitaldrug District*.—The bangle manufactory at Malebannur, which has been in existence for some time, and the several cotton ginning factories at Davangere have become profitable concerns.

Conclusions from the above re-spect.

50. From the above review it will appear that in spite of the failure of harvests in 1904-05, 1905-06 and 1907-08 and of the prevalence of scarcity in 1908-09 in parts of the State and of the recrudescence of plague during the greater part of the decennium, the material condition of the people has improved, the bad seasons having been followed by good seasons and the landed classes profiting by the high prices of food grains, and that the increase of 4·8 per cent over the population of 1901 is a natural one under the circumstances.

Analysis of the growth of population in districts.

51. As the increase of 4·8 per cent in the population during the decade (1901-11) is not uniformly distributed throughout the State and the variation ranges from an increase of 10·4 per cent in the population of Chitaldrug District to a decrease of 5·8 per cent in the population of Kadur District, it is necessary to ascertain the rate of growth in the several districts and taluks. There has been growth of population in all the districts except Kadur and Shimoga, the percentages of increase varying from 2 in Hassan District to 10·4 in Chitaldrug District and the percentages of decrease varying from 2·8 in Shimoga District to 5·8 in Kadur District. The appended maps show the percentage increase and the increase in density in the several districts.

Detailed examination of the results.

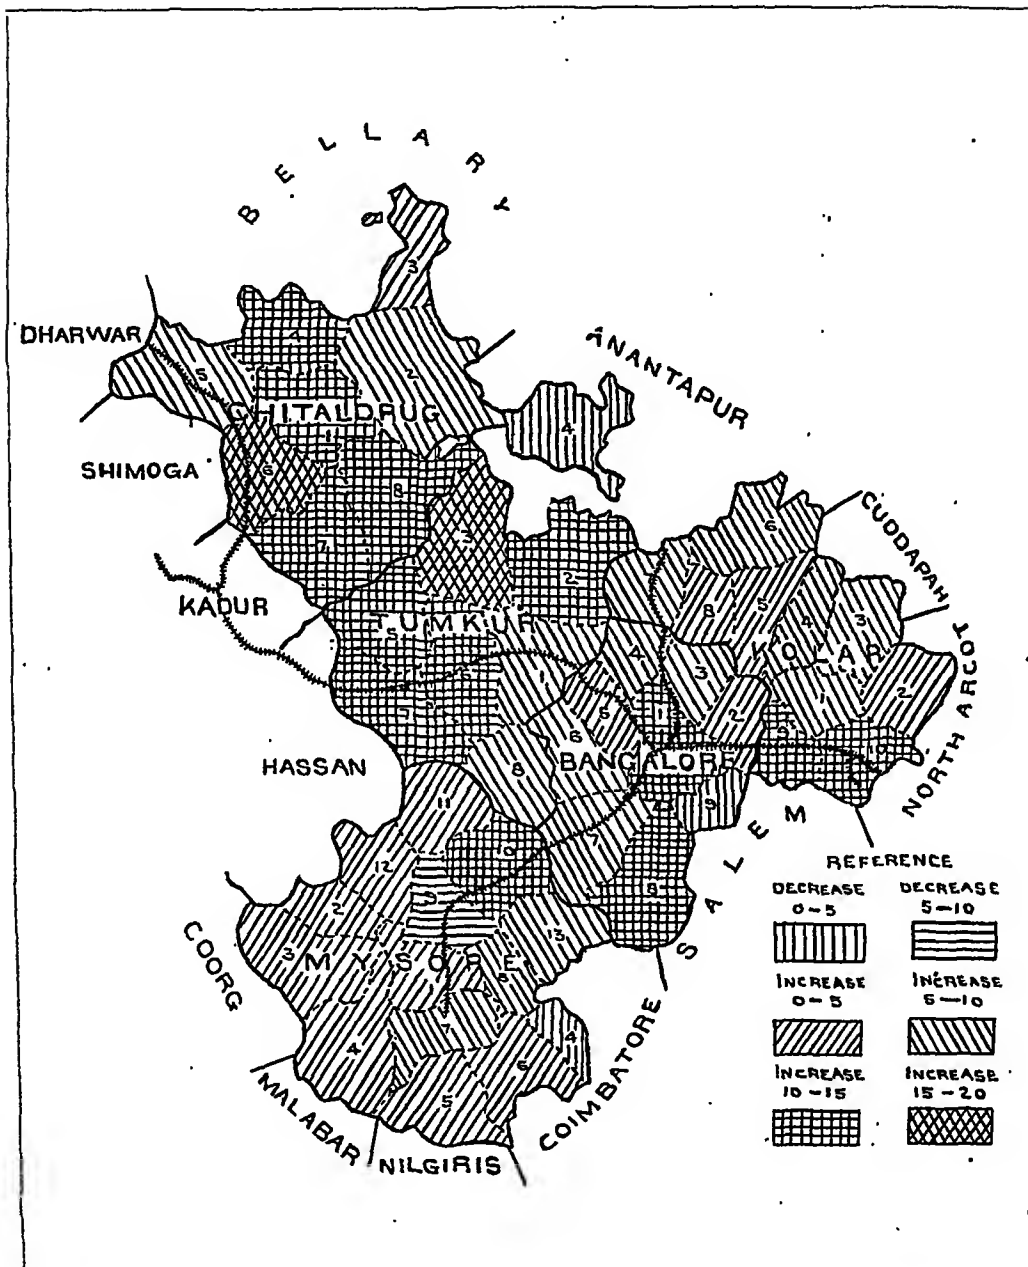

52. We shall now proceed to examine the variation of population in each district. In the maps illustrating the percentage increase in taluks, the percentages of variation for such of the taluks as have cities and sub-taluks are consolidated and differ from those given in the Provincial Table I, which gives the variation for sub-taluks and cities separately from the taluks in which the former are situated. It has been considered desirable to adopt this procedure for the maps and for the discussion as the effect of migration between the taluk and city (or sub-taluk) will thereby be eliminated. The population of the Civil and Military Station, Bangalore, has, however, not been included in the population of the Bangalore Taluk or Bangalore District.

- (1) *Bangalore District*.—The percentage of increase during the decade has been 7·4 for the district including city. Of the nine taluks in the district, only one, i.e., Anekal Taluk, has suffered a loss of population to the extent of 3·29 per cent, the increases in the other taluks varying from 3·39 per cent in Nelamangala Taluk to 13·70 per cent in Kankanhalli Taluk. The Deputy Commissioner attributes the decrease of population in Anekal Taluk to the effects of plague. The increase in the occupied area during the decade has been 55,292 acres, but the irrigated area has declined by 4,759 acres. The district has been steadily increasing in prosperity since 1881.

(2) *Kolar District.* The population of the district including Kolar Gold Fields has grown by 7.8 per cent during the decade and all the taluks have shared in the general growth, the percentages of increase varying from 1.25 per cent in Chikballapur and Siddachhatta Taluks to 13.67 per cent in Bowringpet Taluk (including Kolar Gold Fields). There has been an increase of 50,940 acres in the occupied area and of 21,116 acres in the irrigated area during the decade.

(3) *Tumkur District.* The percentage of increase during the decade has been 9.7. All the taluks, except Pavagada show an increase of population, the percentages of increase varying from 7.64 in Kunigal Taluk to 15.09 in Sirsi Taluk. The diminution of population in Pavagada Taluk is trifling; but the large decrease of 7,200 acres in the irrigated area and the large increase of 45,545 acres in the occupied area of the taluk during the decade are rather abnormal. During the decade, the occupied area and the irrigated area in the district have risen by 127,683 acres and 16,894 acres respectively.

(4) *Mysore District.*—The population of the district including the city has risen by 3.6 per cent during the decade. The growth of population has been general in all the taluks except Seringapatam and Yelandur, the increases varying from 2.16 per cent in Hunsur Taluk to 10.70 per cent in Mandya Taluk. The decrease of Seringapatam Taluk is due to the effects of plague and malaria in reducing the birth-rate and increasing the death-rate. Constant recrudescence of plague in the Yelandur Jagir accounts for the decrease of population in it during the decade. The increase in the occupied and irrigated areas has been 3,576 and 6,225 acres respectively during the decade.

(5) *Chitaldrug District.*—The population of the district has increased by 10.4 per cent during the decade, the increases varying from 3.94 per cent in Molakalmuru Taluk to 16.72 per cent in the Holalkere Taluk. Sufficient time has not elapsed for the development in Hiriyur Taluk of the full effects of the Marikanave Project. The occupied and

irrigated areas in the district have increased by 190,269 and 8,358 acres respectively during the decade; but a portion of the increase in the occupied area represents the area transferred in 1902 from the Chiknayakanhalli and Kadur Taluks to Hosdurga Taluk when the latter was constituted into a taluk (*vide* Government Proceedings dated the 20th April 1902, No. R. 4868-4908—R. F. 16-1900).

The Deputy Commissioner of the district makes the following remarks regarding the different rates of increase in the several taluks:—

“The highest increase is in the Holalkere Taluk. Its nearness to the Railway Station and not being much infected with plague and other epidemics and the successive favourable seasons which this taluk had since last Census have all contributed to the prosperity of the country. Next come in order, the Jagalur, Hosdurga and Chitaldrug Taluks, all of them are nearer the railway communications than any other taluk except perhaps Davangere and Harihar. The comparatively low percentage of increase in the latter two taluks is due to the ravages of plague which had visited these two taluks in almost every year of this decade and which had not yet completely subsided even at the time of this year's Census, and many were found living alone, their families having been sent elsewhere at the outbreak. The increase in Hiriyur Taluk is due, in addition to its share of general prosperity of the country, to the throwing open of the lands under the Marikanave channels for cultivation and the consequent influx of some outsiders. The increase in the Challakere Taluk is 2 per cent below the district average, thus confirming the oft-repeated view that this taluk is the driest and the least rain favoured, that it is more deeply affected by the caprices of the seasons, that scarcity makes its appearance here first and most often and that therefore the scope for progress is limited. The very low increase in the Molakalmurn Taluk is singular. It is free from plague. There is also a railway line from Bellary to Raidrug running on the outskirts of the taluk. Perhaps the inaccessibility of the interior parts of the taluk, the want of ample facilities of communication between one village and another on account of the hilly nature of the tract, have much retarded the progress. The Amildar states further that on account of marriages and festivals a large number had temporarily left the taluk.”

- (6) *Hassan District*.—The population of the district as a whole has increased by 2 per cent during the decade, the increases varying from '47 per cent in Hassan (including Alur Sub-Taluk) to 12'63 per cent in Hole-Narsipur Taluk and the decreases varying from 7'01 in Belur Taluk to 14'70 per cent in Manjarabad Taluk. The heavy decreases in Belur and Manjarabad Taluks are ascribed to the decline in the coffee industry and to the deaths exceeding the births owing to the ravages of malaria.

The Deputy Commissioner further states that there is employed on the coffee and cardamom estates of Manjarabad Taluk a large floating population of labourers from South Kanara and other taluks of Hassan District and that this population returned to their homes prior to the date of final Census.

The causes of the decrease of population in this and other *malnad* tracts are being investigated by the Sanitary Commissioner (*vide* Government Proceedings No. 6127-35—San. 92-09-3, dated the 24th April 1910, reviewing the Sanitary report for the calendar year 1908). The occupied area in the district has decreased by 13,894 acres and the irrigated area has increased by 11,861 acres during the decade.

- (7) *Kadur District*.—The population of the district has declined by 5'8 per cent during the decade, *i.e.*, to about the same extent as during the decade 1871-81. The decreases have taken place in all the taluks except Kadur and range from 5'79 per cent in Koppa (including Yedahalli) to 11'29 per cent in Tarikere.

The occupied and irrigated areas have increased by 4,891 and 16,047 acres, respectively, during the decade.

The causes of the decrease of population are similar to those given in the case of Belur and Manjarabad Taluks. The Deputy Commissioner also ascribes the decline in part to plague.

- (8) *Shimoga District*.—The population of the district has declined by 2'8 per cent during the decade and the decrease has affected all the taluks except Shimoga and Channagiri. The decreases vary from '57 per cent

in Honnali to 10·15 per cent in Sagar Taluk. The Deputy Commissioner of the district has made the following remarks regarding the depopulation in the *semi-malnad* and *malnad* taluks:—

“The question of the so-called decimation of the *malnad* population has for some time past been engaging the attention of Government and they have also ordered an investigation into the causes that have brought about a decline in the population of *malnad* tracts. * * * It is interesting to note, however, that the Sub-Division Officer of Sagar has ventured to remark that ‘the depopulating force of insanitation is a thing to be counted. This is a very serious matter and requires to be tackled with earnestness. Effective steps have to be taken to improve sanitation and reduce mortality or otherwise eradicate the causes of depopulation so that a better state of things than what exists at present may be established.’”

“The *maidan* taluks of Chunnagiri and Honnali show a decided and fairly uniform rate of increase from the Census of 1881; Honnali shows a slight decrease in 1911 probably due to local movements of population. The figures of 1881 show a well-defined fall as the result of the famine of 1877. It is perhaps unnecessary to say more about this group than that it presents the same conditions as prevail in the other *maidan* taluks of the State.”

“Coming now to the *semi-malnad* (Shimoga, Sorah and Shikarpur Taluks), it is evident that the figures relating to the taluks comprised in it disclose conditions entirely different from those of the *maidan*. The first point which strikes the attention is that the famine of 1877 has not had the same depressing effect in the *semi-malnad* as in the *maidan* which would countenance the inference, *ceteris paribus* the *semi-malnad* is better suited to support population in bad seasons than the *maidan*, or in other words that the natural resources of this tract are well in excess of the needs of the population.”

“But looking at the figures as a whole, it is apparent that there are causes at work which tend not only to neutralise the effects of this abundance of resources, but to counteract the natural tendency of population towards increase. These causes, whatever they may be, have kept the population almost stationary; if anything, there is a slight inclination downwards. It need only be said that Sorah, which is more nearly *malnad* in its characteristics than *semi-malnad*, exhibits the conditions which will be noticed when speaking of the *malnad* taluks.”

“Coming now to the most interesting group that of the purely *malnad* taluks (Sagar, Nagar and Tirthahalli), it is at once evident that the famine of 1877 has had the strange effect of bringing about a rise of population. The explanation of this apparent paradox lies in the fact that the *malnad* is by its situation and configuration, no less than by the fertility of its soil less liable to be injuriously affected by drought and adverse seasons; and that its natural capacity is far in advance of the requirements of its population. The result was that the distress elsewhere drove population into this tract, and for a while brought about an increase. If this explanation is correct, it must follow that the increase must have been greatest in those taluks which are most advantageously situated as regards lines of communication. * * * It may then fairly be said that the *malnad* is capable of maintaining a large population without strain on its natural resources even in the most adverse seasons.”

“But it is abundantly manifest that some cause is at work here, more potently than in the *semi-malnad*, which counteracts the fruitfulness of the land and the healthful tendency of population towards growth.” * * *

“Any attempt to assign causes for this decline must, in the absence of facts and scientific investigation, be mere idle guess-work; but it would not be unsafe to say that the invariableness of the result indicates the existence of a constant cause probably to be found in the environment. The fact that the cause which opposes the growth of population as we pass from *semi-malnad* would show that the condition of the climate has something to do with it. How much is attributable to the climate, and how much to such social and hygienic causes as consanguineous marriages in confined communities, and location of village sites with regard rather to agricultural convenience than to sanitary excellence, an inertia of temperament which prevents recourse to medical assistance even where available is a matter to be determined only on patient and exhaustive investigation. Perhaps the day is not far distant when the *malnad* ryot will be as alive to the requirements of sanitation as he now undoubtedly is to his economic interest. A born trader and a wide-awake banker and business-man, he is at present singularly inattentive to the ominous import of low vitality as evinced in a fall of population and the necessity of attempting to improve his environments as the best safeguard of his own permanent prosperity.”

The occupied and irrigated areas in the district have increased by 22,097 and 6,343 acres, respectively, during the decade.

In the India Census Report of 1901, the Census Commissioner has made the following observations regarding this district :—"Shimoga on the Bombay border has only a nominal increase. Very little coffee is grown here; the climate is unhealthy and the population has long been nearly stationary."

Variation
by taluks
according
to density.

53. From Subsidiary Table IV, (a) and (b), it will be observed that the increase of population during the decade has mainly taken place in taluks which had a density of either under 150 or 150 to 300 or in other words in taluks which were thinly or fairly densely populated in 1901.

General
summary
of results.

54. From the detailed examination, it will be observed that the disquieting feature of the present Census has been the decadence of population in the *malnad* and *semi-malnad* taluks of the Western Division, the decrease of population in a few taluks of the Eastern Division being small. The increase of population in the *maidan* districts of the Eastern Division has proceeded with equal pace with the expansion of cultivation and the extension of irrigation in the tracts where the increases have occurred. At the close of 1910-11, 1,062,729 acres of assessed waste land were available for cultivation in the State and there is still room for further increase of population.

Review
of the
growth of
popula-
tion for
forty
years
from 1871
to 1911.

55. The appended diagram shows the growth of population in each district from 1871 to 1911. It will be seen therefrom and from Subsidiary Table I that since 1881 when there was a decrease of population owing to the disastrous famine of 1876-78, the population of the State has steadily increased, the percentage of increase being, however, different at each decade. The explanation lies in the distribution of population by age and by race and religion at each Census. In 1881 out of every 10,000 females in the State, the number of females at the reproductive age period 15-50, was 5,272, the number of females at the other two extremes 0-15 and 50 and over being 3,668 and 1,060 respectively. The distribution of males by age periods was also similar (*vide* Subsidiary Table II of Chapter V). The decade 1881-1891 being a healthy and prosperous one, the death-rate at each age-period was low and the birth-rate high. The result was that the population increased by 18·1 per cent in 1891. In 1891, the number of females at the reproductive age-periods 15-50 fell to 5,056, the numbers at the other two extremes of life rising to 3,720 and 1,224 respectively. In 1901, the percentage of increase fell to 12·1 and the distribution of population by age-periods underwent a further change, the number of females at the reproductive age-periods 15-50 falling to 4,698 out of every 10,000 females. In 1911, the percentage of increase in the population is 4·8 but the numbers of females and males at the reproductive age-periods have risen from 4,698 and 4,758 in 1901 to 4,896 and 5,044 respectively.

It will thus be seen that there is no such thing as a normal rate of increase and that, other things such as material and sanitary conditions being the same, the increase at each decade depends primarily on the distribution of population by age periods and secondarily on the distribution by race and religion. The second factor is dealt with below.

Distribu-
tion of
popula-
tion by
race and
religion.

56. From Subsidiary Table I of Chapter IV, it will be observed that out of every 10,000 persons, 9,199 are Hindus, 542 are Mnsalmans, 124 are Animists and 103 are Christians, the rest being adherents of the minor religions. The percentages of variation given in columns 7-10 of the same table also show that the Hindus both during the decade (1901-1911) and during the thirty years (1881-1911) have increased slower than the Muhammadans and Christians.

The same table shows that while the proportion of Mnsalmans, Animists, and Christians per 10,000 of population has risen from 479, 117 and 70, respectively, in 1881 to 542, 124 and 103, respectively, in 1911, the proportion in the case of Hindus has fallen from 9,308 in 1881 to 9,199 in 1911. The reasons for this decrease are given as follows in the Imperial Gazetteer (Volume I, page 472) :—

"The gains from the ranks of the Animists are probably exceeded by the losses on account of conversions to Muhammadanism and Christianity; and the social customs of the Hindus, especially of the prevalence of infant marriage and the prohibition of the remarriage of widows tend to diminish their reproductive capacity as compared with the adherents of other creeds."

As regards the Musalmans the same writer gives the following reasons for their more rapid increase than the Hindus:—

"Their (Musalman) girls are given in wedlock at a later age and their widows are allowed to remarry so that a larger proportion of their females of the child-bearing ages are married; their dietary is more nourishing; and in the absence of the various marriage difficulties which so often embarrass the Hindu father of a large family of girls, their female children are taken better care of than is often the case with the Hindus. The natural rate of increase is thus relatively high; the loss by conversion to other religions is insignificant; and there is a steady, though small, gain by accessions from the ranks of Hindnism."

DIAGRAM SHOWING THE POPULATION OF EACH DISTRICT AT EACH OF
THE FIVE CENSUSES OF 1871, 1881, 1891, 1901, AND 1911.

EACH DIAMOND REPRESENTS 50,000 PERSONS.

	1901 to 1911	-31,312	+6,760

NOTE.—For purposes of this table the cities of Bangalore, Mysore and Kolar Gold Fields and Civil and Military Station, Bangalore, have been each treated as a Taluk.

CHAPTER III.

MIGRATION.

57. Owing to the necessities of civilization, persons will move out of the tracts where they are born, and for the transaction of their various affairs, people come together "even from distant islands, from the middle of the seas or the ends of the earth." A few there are, who go "to fresh woods and pastures new" simply on pleasure, travel or adventure bent; while many do so, forced thereto by the hard lot at home and the need for seeking livelihood elsewhere, or else allured from their homes by better prospects of successful careers in the new land, while others yet again fluctuating in numbers, have to do so in the ordinary course of business or of visiting their relatives or of paying devotional visits to shrines dear to their heart. The unceasing movement that thus goes on in the population is taken note of, for the purposes of the Census, synchronously on a particular day by the district of birth (if the country is outside India, the country) being entered against the name of each individual enumerated. The compilation of the information thus collected with regard to the individuals censused enables us firstly to ascertain the natural growth or otherwise of the different districts of the State, and secondly, to note the extent to which the people move from district to district or outside the State. It is the purpose of this chapter to investigate the extent of the movement or migration above referred to, deducible from the statistics of birthplace, the growth of population having been studied in the last chapter (Movement of Population).

Scope of chapter.

58. It has been objected to, that the return of birthplace in the Census schedule is no index of migration, inasmuch as the casual presence of a particular person at a particular place on a particular day, may have been the result of a hundred fortuitous circumstances, all of which, to take an extreme case, may not pertain to the person's ordinary habits of life. It is true that the Census enumeration is more or less a snap-shot; it is confessed too that the snap-shot may not unoften give an illusory view. But it has to be admitted that the 'snap-ping' process is comprehensive and synchronous all over the country and that as a result of this, and arising out of the fact that most people scarcely ever move out of their birth *districts* (not *birthplaces*) the snap-shot is bound to reveal even in the matter of birthplace and Census district, a fairly accurate and faithful picture of the mass of the population. From the point of view of the statesman and the student, the statistician's fact with all its natural shortcomings is preferable to the poet's fancy, the chronicler's legend or the historian's approximation. It only remains for us to distinguish the various kinds of migration that may in the panorama be exhibited to our view, after investigating which, we may point to the permanent, semi-permanent or periodic type of migration which is after all what is very ordinarily taken to be migration proper.

How far enumeration of birth District is an index of migration.

59. Migration has two aspects:—Migration to the State and migration from the State, both of which must be studied in order that the net effect of migration on the population may be estimated. According to its origin it has also been classed as *centrifugal* (directed from a particular area) and *centripetal* (directed towards a particular area).

Statistics for discussion.

(a) *Immigration*.—The statistics of immigration are contained in Imperial Table XI which gives the statistics of the persons enumerated in the divisions, districts and cities of the State by birthplace. It is to be noted that in this table, information by birth districts is available only for the State and the contiguous parts of the adjoining Provinces; in other cases, totals for provinces and countries are given. Cities have been considered as part of the districts in which they are situated when they have to be reckoned as birthplaces. Supplementary statistics regarding birthplace combined with age, caste and occupation,

are given for the cities of Bangalore and the Kolar Gold Fields next after Imperial Table XI. Birthplaces from which there is a noticeable current of migration are dealt with in this table and only the castes returning large numbers are tabulated for.

(b) *Emigration*.—The statistics of emigration from the State are not so complete as one could wish. We have only extracts of Imperial Table XI furnished by the Provincial Superintendents of the several Provinces and States in India. No accurate information is available of persons born in Mysore but who are living in countries outside the Indian Empire with the exception of the Mysore-born enumerated in Ceylon, Hongkong, Rhodesia, the Straits Settlements and the Federated Malay States. In the absence of Census or immigration register figures from those countries and in the non-institution of registration of emigrants from Mysore to those countries, it is impossible to furnish any reliable statistical data. Indian labour has been in great demand for developing new countries in various parts of the world and Mysore must have contributed its mite. As many as 3,615,742 emigrants embarked from the ports of Calcutta and Madras for the various colonies during the year 1900-10 and as many as 3,039,447 persons returned to these ports from the colonies during the decade. Besides this inflow and outflow, there were, as reported by the Protector of Emigrants, Calcutta, 679,464 Indians resident in certain colonies at the end of 1909. We learn that 474 emigrants from Mysore to Natal and Mauritius were registered by the District Magistrate of Bangalore between 1891 and 1898 when further registration was stopped, as against 1,243 emigrants during 1881-1891 to foreign places outside India. In these circumstances it seems clear that emigrants from Mysore have travelled to foreign lands. Again the cause of education has taken a devoted few abroad. To forecast the probable number of emigrants outside India is a useless task; for the rates of the increase of such are not within our ken. For example, the number of emigrants to Ceylon from Mysore in 1911 is more than 12½ times the number for 1901. The figures for emigration so far as they are available are embodied in the Subsidiary Tables.

61. An illustrative diagram is appended showing the proportional migration **Diagram.** to districts and cities by sexes and indicating the contiguity or otherwise of the birth district, whether in the State or outside of it in India.

down its sides; and one can catch glimpses of the thrifty husbandmen watching the irrigation to, and the crops of, their fields. Of these, the last two divisions being nearer akin in physical features and climate constitute the Eastern Division. Each of these divisions had consequently a history of its own and though consolidated into practically one kingdom at the end of the 17th century A. D., still retains its peculiar features in the matter of climate, style of agriculture, trade and outlets for natural resources, though in the matter of trade, railway communications have made the western and southern parts look more and more to the east and north. From the standpoint of immigration, the western part draws its immigrants from the two Kanara districts on the Malabar Coast. The eastern part looks eastward towards the Madras districts of North Arcot, Bellary, Anantapur and Cuddapah, while the southern part gets the fewest immigrants of all, chiefly from Coimbatore. The moist and slightly malarial climate of the western portion, its abundant rainfall, its woody arecanut gardens rising tier on tier, its numerous coffee and cardamom plantations, its rolling paddy flats in the midst of jungle and hill, its fertile soil and consequently fairly easy life for the scanty population it supports—all these necessitate a big periodic or seasonal inflow of labourers from the western lowlands who generally march in about September of each year and depart in May the next year, before the south-west monsoon bursts on the Western Ghats. The eastern portion, the Tumkur District being typical, on the other hand which depends for a prosperous year on the bountiful showers of both the south-west and north-east monsoons, wants permanent or semi-permanent settlers to derive any benefit from residence there. The neighbouring districts of Bellary, Anantapur and Cuddappah being less favoured in respect of the monsoons than the adjoining districts of Mysore, contribute the main bulk of such. The gold industry of Kolar District perforce commands cosmopolitan attention, but the most numerous immigrants are from the neighbouring North Arcot District. The Civil and Military Station, Bangalore, being the headquarters of the Imperial Military Force stationed in the State and the entrepot for foreign goods, likewise gets immigrants from all parts of India and has most of the European and continental immigrants resident there. Bangalore City, a centre of commerce and an important railway junction, is close to the Civil and Military Station, Bangalore, and has a good climate. Its cotton and woollen mills, and the several extensions give employment to many labourers from outside. The immigrants to Kolar District include many who are labourers, builders and traders, following in the wake of the goldmining industry but have been enumerated outside the area of the Gold Fields. The southern portion which comes a very bad third in immigration, is more or less self-contained, what with its river irrigation and healthy climate, and the immigration into this portion is mainly casual or accidental. Except in the vocations of agriculture and petty trade, foreign influence on the occupations found in the State pervades through outside settlers who are consequently found at work in most of the occupations enumerated in the State, chiefly in industry, trade and Government service.

The mean density for the State per square mile in 1911 is 197 and the highest density amounts to 307 in the case of Bangalore District (including Bangalore City and Civil and Military Station, Bangalore). The density of population of the Madras Presidency is 291 per square mile, the adjacent districts of Malabar, North Arcot, South Kanara, Coimbatore, Salem and Chittore, having each a density more than that of the Mysore State, *viz.*, 520, 399, 297, 294, 280, and 218 respectively. The density of population in Dharwar and North Kanara is 223 and 109 respectively. Very probably the strenuous life at home may have prompted some of the immigrants to go over to the neighbouring Province—Mysore.

65. The domestic and social relations that no artificial restrictions of boundaries of States can bar, are responsible for a good many of the emigrants going into the neighbouring districts of British India. The entrepots for trade and ports being situated outside the State and connected with towns in Mysore by roads and railways, many commercial people have to maintain relations with their *confreres* in Bombay, Madras and elsewhere. The coffee plantations of Coorg draw many labourers from the Mysore District. The density of population per square mile for Coorg is 114 (1901). The Civil and Military Station, Bangalore, attracts the migration thereto, on official and private business, of people from all parts of India, and the children of such sojourners who may be born in Civil and

Conditions inducing migration (continued)—
(b) from the State.

Military Station, Bangalore, may in course of time be enumerated as emigrants from Mysore. The cause of education, higher and technical, always takes away a few emigrants to centres of light and learning in British India and the United Kingdom.

Condi-
tions of
import-
ance,
during
1901-11,
influen-
cing mi-
gration.

66. The general advance in the line of civilization necessitated by existence in the midst of progressive conditions, has had its influence in producing an increase of immigrants and emigrants. The communications, road and railway, remained almost the same as in 1901. The intense desire for developing local industries which was felt during the decade throughout India, showed itself in the increased attempts at mining and prospecting and exploring for economic products in the State. The substitution of electricity as motive power in the Kolar Gold Fields meant a larger output and there was a small increase in the numbers employed in the mines. A few praiseworthy attempts at introducing scientific methods into industries, *e.g.*, Tobacco Factories, Saw Mills, marked a step in the general advance in industries. The large public works on the Marikanave lake (Chitaldrug District) and the new Palace (Mysore City) were completed during the decade. Advantage of the completion of the former has begun to be taken both by subsistence and capitalist farmers.

General
conclu-
sions.

67. (a) The increase of population during the decade 1901-11 is 266,794 persons. The balance between immigration and emigration during the decade has been shown in Chapter II to be approximately 68,916 persons.

(b) Though an inland country, Mysore has a very large population of immigrants (5 per cent) as compared with most provinces in India, *e.g.*, Madras (which has less than 1 per cent) on account of the mining industries (notably gold) and coffee and cardamom plantations, of which it is the home. A study of Subsidiary Table III is very instructive as regards immigration into the several districts. The proportion per mille of immigrants (cities excluded) is only 18 in the Mysore District, while the planting district of Kadur has the highest proportion, *i.e.*, 162, the districts of Shimoga and Kolar coming next with 104 and 102 respectively. Of the cities, the Kolar Gold Fields, which is more or less a semi-permanent camp has as many as 851. The Civil and Military Station, Bangalore, comes next with 343, Bangalore City follows with 299, while Mysore City has only 137 to its credit.

(c) The proportion of emigrants to immigrants is 45 per cent; which shows that Mysore gains more by migration than it loses.

(d) The proportion of females to males, emigrants or immigrants is always, from the nature of the circumstances, greater in the case of contiguous districts than in the case of other places. For the State including Civil and Military Station, Bangalore, the number of females per 100 males is 81 and 73, in the case of immigrants from contiguous districts and other places respectively and 108 and 84 in the emigrants to the tracts described above.

(e) The streams of migration flowing either way are cosmopolitan, no particular caste or creed predominating when the figures are considered with reference to the actual populations of the provinces that give to and take from the Province.

(f) In the case of immigrants to the cities the special return compiled which combines with birthplace, particulars of age, caste and occupation, shows that the few castes of Beda, Brahmin, Holey, Mudaliar and Vakkaliga alone return nearly 41 per cent of the immigrants into Bangalore City, while in the Kolar Gold Fields, the caste Holey and the races of Europeans, Anglo-Indians and Indian Christians return as many as 22,401 or more than one half the number of immigrants into the area.

(g) A point worth noting here is the distinction between the character of immigration into the cities and the rural tracts. In the former, the bulk of the immigrants hails from afar, there is not

much inequality* between the numbers of males and females returned and the character of the migration is permanent or semi-permanent, while in the latter, the bulk are from the adjoining districts, there is a disproportion between the sexes immigrating and the immigration is either casual or periodic. The Civil and Military Station, Bangalore, and the Kadir District may be taken as types of the city and district respectively.

68. Next after the general discussion of the subject, we may take up the balance sheet, if the word may be used, of population crossing the border between the State and the other countries. The immigrants from outside India consist chiefly of Europeans from the United Kingdom and Ireland, members of the British Army and Civil Services stationed in the Civil and Military Station, Bangalore. Trade in foreign goods, industry (gold in Kolar and manganese in Shimoga), the evangelistic missions and service under the Local Government all support the majority of the other European immigrants into the State. Travel and sport in this picturesque and historic land have also attracted a few. The Asiatic immigrants are chiefly itinerant traders such as are to be found in any big city in the East congregated mostly in the Civil and Military Station, Bangalore. Regarding emigrants from Mysore outside India complete information is not available. Eight thousand one hundred and eighty-nine persons have gone to Ceylon in search of work in the plantations and a very few have travelled to Europe and America for education.

Extra-provincial migration—
(a) outside India.

69. Subsidiary Table V appended to this chapter shows in respect of each province or state, the immigrants therefrom and the emigrants thereto from Mysore. The only provinces from and to which the flow of migration is noticeable are Madras Presidency, Bombay Presidency (including states), Coorg, and Hyderabad. Of the others the most noticeable are (1) Rajaputana which gives to Mysore some of its thrifty money-lenders and brokers and (2) the Punjab which sends its hardy sons to the British Army stationed in Mysore. A few remarks with respect to the first four provinces thus singled out are noted hereunder.

(b) To Provinces and States in India beyond Mysore.

- (1) *Madras Presidency*.—Mysore State is surrounded on all sides (except towards Dharwar and North Kanara) by districts of the Presidency and it is no wonder that the bulk of the Indian immigrants into Mysore, *i.e.*, nearly five-sixths, is from this Presidency. So also the bulk of emigrants from Mysore is to the Madras Presidency. The highways leading to the Madras districts are not so steep and difficult as those leading through the Western Ghats to the Bombay Presidency. Social relations in respect of which political and administrative boundaries afford no let or hindrance, bring about this mighty flow both ways. Besides such casual migration attributable to social relations, the periodic migration into the planting districts of the West and the semi-permanent camp of the Kolar Gold Fields area are responsible for the large excess, *i.e.*, 170,859, of immigrants from Madras over emigrants to the Presidency from the Mysore State.
- (2) *Bombay Presidency*.—The Dharwar and North Kanara districts of the Presidency lie to the north-west of the State. There are no special conditions affecting the flow of migration either way. The outlet for the trade of the Shimoga and Chitaldrug Districts is into the Bombay Presidency. The excess of immigrants to Mysore over emigrants to Bombay comes up to 14,971.
- (3) *Coorg*.—The conditions of migration between the State and the Madras Presidency are reversed in the case of Coorg which takes in 13,046 more than it sends. This is due to the extensive plantations of Coorg for which there is a perennial demand for labour from the neighbouring districts of Mysore and Hassan.
- (4) *Hyderabad*.—The inflow and the outflow are about equal in this case.

* NOTE.—This statement does not hold good in the case of the European rank and file of the British Army stationed at Bangalore.

persons aged 15-40 is far greater than those aged 0-15 and 40 and over and also that amongst these the numbers of males between 15-40 invariably exceed the numbers of females far more than the number of males of the other age-periods compare with the number of females of the age-period concerned. This is because the exigencies of life in the cities demand the preponderance of adult immigrants, over infants and aged immigrants, and among the adult immigrants, of males over females. The chief occupations that attract immigrants are, in the case of the Bangalore City, Government service, domestic service, building industries and to a small extent, trade; in the case of Kolar Gold Fields, they are mining, domestic service, building industries and transport.

72. During the decade there was a transfer of an area containing 8,785 persons from Tumkur to Chitaldrug. The figures of migration for 1901 for these two districts not admitting of any alteration to suit the altered actual populations, there is a difficulty in gauging the variation of migration to each of these districts. This should be borne in mind while criticising the available figures for migration from the two districts. There was likewise a transfer of an area containing 3,482 persons from the Kadur District to the Chitaldrug District. The number of immigrants from provinces, states and foreign settlements in India into Mysore in 1911 exceeds the number for 1901 by 4,527 and the number of emigrants from Mysore thither in 1911 is less than the figure for 1901 by 447. The emigrants to Ceylon in 1911 number 8,189 (5,092 males and 3,097 females) whereas in 1901 they numbered only 638 (340 males and 298 females). This very remarkable increase in figures is due to the successful operations of the recruiting Ceylon Labour Commission working in Bangalore City.*

Variation in migration since 1901.

Noticeable fluctuations since 1901 in immigration are: Bombay (-7,112), Madras (+8,445) and the Punjab and North-West Frontier Province (+1,567) and Europe (+1,957); remarkable changes in the emigration figures since 1901 are: Bombay (+821), Coorg (-8,596), Madras (+3,073) and Hyderabad (+2,520). The following remarks are made in respect of a few of these countries:—

- (1) *Bombay*.—Going to district figures we see decreases of Bombay immigrants to Kadur, Chitaldrug, Hassan and Mysore. The coffee industry in Kadur and Hassan is not such a paying one now as it was a decade or more ago; in Chitaldrug, the large public works on the Marikanave lake were closed; in Mysore, the skilled artisans, most of them from Bombay, were in 1901 engaged on the new Palace works in Mysore City.
- (2) *Madras*.—The increase is noticeable in Bangalore City, Bangalore District, Kadur and Shimoga. The building industries of the Bangalore City, which town in 1901 was very thinly peopled owing to the prevalence of plague, have attracted about nearly 5,000 more immigrants in 1911. The exploitation of manganese in Shimoga has taken nearly 5,000 more in 1911.
- (3) *The Punjab and North-West Frontier Province*.—The Civil and Military Station, Bangalore, alone accounts for an increase of over 1,000 immigrants. These comprise the ranks of the British Army in Civil and Military Station, Bangalore, the mining watchmen in Kolar Gold Fields and ranks of the detachments of the army on the line of march and in camp in Tumkur and Bangalore Districts.
- (4) *Coorg*.—The work on the plantations in Coorg is slack and there were less emigrants thereto.
- (5) *Europe*.—The increase of 1,957 is chiefly due to increase in the immigrants from the United Kingdom. There has been an increase of nearly 1,200 in the Civil and Military Station, Bangalore. The increases of 319 and 315 in the Bangalore District and Tumkur District respectively are owing to enumeration of units of the British Army on the line of march and in camp on the 10th March 1911.

* NOTE.—Complaints as to the 'modus operandi' of the Ceylon Labour Commission, having come to the notice of Government, the matter was investigated and in order to regulate the recruitment, the 'Mysore Emigration Bill' was introduced in the Legislative Council in February 1912.

counterbalancing one another. Against this there is a slight increase in immigrants from the Bombay Presidency and an increase of more than 5,000 in immigrants from the Madras Presidency.

76. From the free nature of the migration to and from the State, its ready growth from decade to decade and the appreciable excess of immigrants over emigrants it is apparent that Mysore has been taking part in the general advancement of the Indian Empire. There was, as we have seen above, during the decade a loss in the indigenous population of the Kadur and Shimoga Districts but immigration stepped a fair way into the breach. **Conclusion.**

**IV.—MIGRATION BETWEEN NATURAL DIVISIONS (ACTUAL FIGURES)
COMPARED WITH 1901.**

Natural Division in which born	Number enumerated (,000's omitted) in Natural Division	
	Eastern Division	Western Division
1	2	3
Eastern Division 1911	4,123	36
Do 1901	3,829	37
Western Division 1911	23	1,311
Do 1901	24	1,343

NOTE.—1. The figures for Civil and Military Station, Bangalore, have been added to those of the Eastern Division.

2. The entire population of Civil and Military Station, Bangalore, in 1901, shown as enumerated in Mysore State district unspecified, has been added to the Eastern Division figures of 1901.

V.—MIGRATION BETWEEN THE PROVINCE OF MYSORE AND OTHER PARTS OF INDIA.

NOTE.—The figures in columns 2 to 10 of this table do not in some cases agree with those given in columns 2, 5 and 8 of Subsidiary Tables I and II of this chapter, the differences in such cases being due to the adjustment of absolute figures under both Immigrants and Emigrants for each district so as to represent the numbers in thousands.

CHAPTER IV.

RELIGION.

PART I.—STATISTICAL.

77. This chapter consists of two parts—(1) statistical and (2) general. In the first part the statistics will be discussed absolutely, relatively to the statistics of the previous Censuses and proportionately to a common figure such as 10,000 or 1,000. So much of the history and conditions of a religion will be given as will suffice to help the reader to comprehend the significance of the discussion. Introductory remarks.

78. According to the Slip-system of Abstraction and Tabulation of the information collected in the Census Schedules, adopted in 1901 and 1911, the distinctions of religion and sex are preserved during compilation of all the tables of statistics with reference to any particular unit, for the sake of convenience of tabulation. Thus, though religion may be said, in one sense, to enter into the preparation of all the tables (in the final form of some, the distinction by religion is not shown), yet for the purposes of this chapter, the following tables are those chiefly referred to:— Statistics.

- (a) Imperial Table VI Religion: giving figures for the population and for each religion by districts and cities.
- (b) Imperial Table V: Towns arranged territorially with population by religion.
- (c) Imperial Table XVII which deals with the territorial distribution of the Christian population by sect and race.
- (d) Provincial Table II giving figures for the chief religions in respect of taluks and cities.

79. The salient features of the statistics are brought together in seven Subsidiary Tables appended to this chapter. These are:— Subsidiary tables.

- I. General distribution of the population by religion, showing, for the State and Natural Divisions, in respect of each religion, the actual number in 1911, the proportion per 10,000 of the population in each of the last four Censuses, the percentage of variation during each decade, and net variation for 1881-1911.
- II. Distribution by districts of the main religions: giving for each of the last four Censuses, the number per 10,000 of the population who are Hindus, Musalmans, Christians, Jains, Animists and of other religions.
- III. The number and variations of Christians in each district at each of the Censuses in 1911, 1901, 1891 and 1881.
- IV. The actual numbers of the races and sects of Christians.
- V. Distribution of Christians per mille (a) races by sect and (b) sects by race.
- VI. Religions of urban and rural population (for Natural Divisions).
- VI(a). Religions of urban and rural population (for districts and cities).

80. A diagram is given to show the Musalman, Christian, Jain and Animist population in each district and city. Another has been given to show the number of persons in every 10,000 in each district and city who are Hindus, Musalmans, Christians, Jains and Animists. Diagrams.

MUSALMAN CHRISTIAN JAIN ANIMIST

General distribution of the population by religion.

81. The State contains 5,340,908 Hindus, 314,494 Musalmans; 72,196 Animists, 59,844 Christians, 17,630 Jains, 622 Buddhists, 293 Sikhs, 101 Parsis, 65 Brahmos and 40 Jews, making in all 5,806,193 persons. For every 10,000 of the population, 9,199 are Hindus, 542 Musalmans, 124 Animists, 103 Christians, the remainder consisting of adherents of other religions. There has been a steady increase during the decade 1901-11 of the numbers of the Hindus, Musalmans, Christians, and Jains, the variations for these and Animists being +4·7, +8·6, +19·5, +28·9 and -16·7 per cent respectively. The variations in the other religions have no statistical value inasmuch as the followers of those religions are very few numerically and consequently no general inference could be deduced from a study of the figures. As the increase of the total population in 1901-11 is 4·8 per cent, the only notable increases are in the case of Jains, Christians and Musalmans. The decrease under Animists is found to be due to many of the Animist castes (16,491 persons) returning themselves as Hindus in the present Census.

The Civil and Military Station, Bangalore, contains 56,546 Hindus, 22,786 Musalmans, 20,430 Christians, 347 Animists, 320 Jains, 233 Sikhs, 72 Buddhists, 46 Parsis, 34 Jews and 20 Brahmos, making in all 100,834 persons. In other words, out of 10,000 persons 5,608 are Hindus, 2,260 Musalmans, 2,026 Christians, 34 Animists, 32 Jains and 40 of the other religions. The general increase in the decade 1901-11 is 12·5 per cent, the increases in the cases of Hindus, Musalmans and Christians being 11·5, 5·7 and 19·3 per cent, respectively.

The Eastern Division contains 4,269,986 persons, 3,959,805 being Hindus, 223,107 Musalmans, 46,695 Animists, 28,529 Christians, 11,178 Jains, 524 Buddhists, 52 Sikhs, 49 Parsis, 45 Brahmos and 2 Jews. The number per 10,000 of population works up to 9,274 in the case of Hindus, 523 Musalmans, 109 Animists, 67 Christians and 26 Jains. The general increase in population for the division since the Census of 1901 is 7·0 per cent, the variations for Hindus, Musalmans, Animists, Christians and Jains being +6·7, +11·2, +5·7, +22·5 and +68·7 per cent, respectively.

The Western Division which is only about half the area of the Eastern Division and the percentage of cultivable area to the total area of which is only 39·2 as against 48·4 of the Eastern Division, has a population of 1,435,373 persons, 1,324,557 of whom are Hindus, 68,601 Musalmans, 25,154 Animists, 10,885 Christians, 6,132 Jains, 26 Buddhists, 8 Sikhs, 6 Parsis and 4 Jews. Expressed per 10,000 of the population, there are 9,228 Hindus, 478 Musalmans, 175 Animists, 76 Christians and 43 Jains. The variation for the decade is -1·7 per cent, the variations in the case of Hindus, Musalmans, Animists, Christians and Jains being -0·9, +1·8, -40·8, +12·8 and -11·8 per cent, respectively. There was during the decade the transfer of an area containing 3,482 persons from the Western Division (Kadur District) to the Eastern Division (Chitaldrug District).

Features of the distribution of the religions in the districts and the cities. (proportionate figures considered.)

82. (a) *Hindu*.—It should be noted that the figures include only those who returned themselves as Hindus in the "Religion" column of the Census Schedule and in whose case an entry being the name of a distinctive religion such as 'Jain,' or 'Sikh' did not occur in the 'Caste' or 'Sub-Caste' column. Animist castes who described themselves as 'Hindu' in the 'Religion' column were classed as 'Hindu' while they were taken as Animists when the caste name was repeated in the column. The Mysore District contains the highest proportion per 10,000, *i.e.*, 9,643, Shimoga District containing the least, *i.e.*, 8,965. Of the cities, Bangalore City has as much as 8,193, while the Civil and Military Station, Bangalore, has only 5,608.
- (b) *Musalman*.—The Shimoga District has the largest number per 10,000 (663) and the Mysore District has the least (298). Among the cities, the Civil and Military Station, Bangalore, has the largest proportion, *i.e.*, 2,260, while Kolar Gold Fields has only 638.
- (c) *Christian*.—The Kadur District has the largest proportion per 10,000, *i.e.*, 134, Chitaldrug District having the least, *i.e.*, 4. Of the cities, the Civil and Military Station, Bangalore, has 2,026, the Kolar Gold Fields 1,986, Bangalore City 478 and Mysore City 302.

- (d) *Jain*.—The Jains number 58 per 10,000 in Shimoga District and only 14 in the Mysore District. The Kolar Gold Fields (City) contains no Jains; Bangalore City, Mysore City and Civil and Military Station, Bangalore, have for every 10,000 persons, 50, 45 and 32 respectively.
- (e) *Animist*.—Shimoga District has the largest proportionate number 264 and Mysore District the least, *i.e.*, 33. Of the cities, Bangalore has 80, while Kolar Gold Fields has only 1.
- (f) *Other Religions*.—It is the cities that have the bulk of the followers of the other religions *i.e.*, Sikh, Brahmo, Parsi, Jew and Buddhist. It is the increase of the adherents of this last mentioned religion that accounts for the high proportionate number of 97 in the Kolar Gold Fields.

83. It is remarkable that Shimoga District has thus the largest proportion per 10,000 of the population among Musalmans, Animists and Jains; Mysore District contains the largest proportion of Hindus, while Kadur District has the largest proportion of Christians. The explanation seems to be due to historical causes in the first three instances and to economic conditions in the last two. A suggested explanation of the foregoing.

1. *Shimoga District*.—(a) In the Bijapur Musalman invasion of Mysore in 1637 under Randulhakhani and Shaji, the father of the famous Sivaji, the Bednur and Beikpur country was thoroughly overrun. "By settlement, conquest and conversions there were considerable numbers of Muhammadans employed in the Military and other services of Mysore, Bednur, Chitaldrug and other provinces at the time of Haider's usurpation in 1761,"* so much so that a 'Navayat' Muhammadan is said to have commanded the forces of Bednur in the decisive battle of Mayakonda (Chitaldrug District) in 1748 against Madikere Naik, the Poligar of Chitaldrug.
- (b) In the 18th century, the Mahratta armies swooped down on Mysore through this district time and again. The Lambani camp followers of the armies must have stuck to the country. During the Mahratta and Mysore wars of the century it was that the Lambanis came prominently to notice when "immense numbers of them were employed by the armies of both sides as foragers and transporters of supplies required for the troops."†
- (c) The present village of Humcha (in the Nagar Taluk) was the capital of a Jain principality founded by Jinaditya whose dynasty was flourishing from the 8th to the 12th centuries A. D. and is even now the seat of a Jain monastery.
2. *Mysore District*.—The Muhammadan invasions were all from the north and north-west. This district lying to the south of the country as it does retained its essentially Hindu character despite the "settlement, conquest and conversions" of the new religion.
3. *Kadur District*.—The coffee plantations of Chikmagalur, Koppa and Mudgere Taluks command the immigration of Konkani speaking Indian Christian males and workmen from South Kanara. Hence the proportionate figure has gone up for this district.

In the case of the Civil and Military Station, Bangalore, and the Kolar Gold Fields, it is the nature and economic conditions respectively of these cities that have brought together people of various religions, the number of Musalmans and Christians being prominent in the former and of Christians in the latter.

84. A study of Subsidiary Table VI reveals to us the fact that the Hindus though predominating in both the urban and the rural populations, are very much less so in the former than in the latter. Animists are essentially a rural population, their number per 10,000 of population in the rural area being thrice as much as the number per 10,000 of population in the towns in the Eastern Division (including Civil and Military Station, Bangalore), while in the Western Division, the number is nearly 4½ times as much. Musalmans, Christians and Jains are Religions of urban and rural population.

* Mysore Gazetteer, 1897, Vol. I, page 480.

† Mysore Gazetteer, 1897, Vol. I, page 231.

together but community of occupation? From time to time great thinkers and men of action arose who realised the absurdity of the religious tie being lost sight of and society being hidebound by meaningless customs. These reformers originated so many sects or rather persuasions, which in turn, when the effect of time was to lessen the hold of the reforming dogma on the adherents, reverted to the tie of community of occupation keeping the sections of society together.

86. Western scholarship in the east occupied itself in bringing to light the treasures of the Indian scriptures and was impressed profoundly with the origin and distinction of castes as laid down in well-known sacred books. The scholars took for granted as existing what the text-writers who consistently with the original Aryan policy of assimilation classified and catalogued existing castes and attributed qualities or origins according to their own ideals, thus leaving it to the people to approximate to what was termed best and highest in the opinion of the most cultured of the time, had written concerning society. Very naturally they took the Brahmans who were the representatives of the old text-writers as the social and religious legislators of all Hindus, including in the term even aboriginal tribes who never so much as knew what a Brahman was. Meanwhile the extension of the Indian Empire and the systematic enquiry into the condition of its inhabitants brought to light, just at a time when scholarship thought it had said its last word about Hinduism, when it said that Brahmans were the arch-priests of Hinduism, that Aryan civilization had never so much as made its appearance in some parts of India: that the imprinting of the Aryan impress was very faint in many cases; and that the term 'Hindu' which the foreigners first applied to the usually known 'Hindus,' was quite inapplicable to many sections of society. The word 'Animist' then came into existence to describe those who do not bear any Aryan impress. But then there was this curious phenomenon, as a result of residence in the proximity of a better civilization, that some 'Animists' called themselves 'Hindus' after their more advanced neighbours, all the more readily because the change did not at the same time involve any change in their beliefs, etc. After this review, we may venture to frame a definition of a 'Hindu' somewhat as follows:—

"A Hindu is a theist believing in the religious evolution which will some day, but surely through worship of God in His various forms (according to the worshipper's ideal) and through good works in his present life or a series of lives, land him in the Godhead compared to whom nothing is real in this world."

Readers desirous of further information on the subject are referred to para 628 of the India Census Report of 1901, and the articles on "Brahmanism" and "Hinduism" in the Encyclopædia Britannica, 11th Edition.

87. Certain castes and tribes (contributing more than one per mille of total population of the State) returning or classed as Hindus are examined below with reference to certain standards and certain disabilities in order to enable the reader to draw his own conclusion as to whether the members of particular castes or tribes may be regarded as Hindus or not.*

- (1) The Lingayats (729,431) *'deny the supremacy of the Brahmans'*; as also the Panchalas (128,098). The aboriginal tribes who have returned themselves as Hindu, Koracha (6,126) and Lambani (9,945) know nothing of Brahmanical supremacy.
- (2) The aboriginal tribes returned as Hindu *'do not receive the mantra'* for Upanayanam *'from a Brahman or other recognised Hindu Guru.'* The time of initiation varies in the case of different castes. The initiation ceremony is denied to castes, such as Holeya (613,248) and Madiga (308,083).
- (3) The Lingayats acknowledge the supremacy of the *Vedas*, but dissent from the performance of the sacrifices and repudiate the efficacy of the *Sraddhas*. (Mysore Census Report, 1901, p. 532.)
- (4) The aboriginal tribes returned as 'Hindu' cannot be said *'to worship the great Hindu Gods.'*

The dis-
quisition
continued.
The term
'Hindu'
defined.

An exami-
nation of
the castes
compris-
ing
Hindus.

* The standards and disabilities with reference to which the castes are examined were suggested by the Census Commissioner for India in his notes for the Chapter on Religion in the Census Report. The Monographs of the Ethnographic Survey in Mysore have been freely consulted in the preparation of this paragraph.

- (5) Holeyas and Madigas and the aboriginal tribes returned as 'Hindu' cannot be said to be '*served by good Brahmans as family priests.*'
- (6) The following castes have '*no Brahman priests*' at all: Jogi (12,881), Madiga, Nayinda (39,414), Neygi (96,466), Tigala (69,233) and Vodda (142,482). The Agasas (97,772) have both Brahman and Jangam priests; the Bedas (268,454) do not have Brahman priests for death ceremonies; the Holeyas merely consult Brahman astrologers and the Kurubas (403,366) have Brahman priests only occasionally. The Komatis (9,813) and Vaisyas (26,497) are gradually displacing Brahman priests who do not minister to them according to the ritual of the Vedas.
- (7) Holeyas and Madigas are '*denied access to the interior of ordinary Hindu temples.*' But at Melkotē in the Mysore District, Ramanujacharya, the Srivaishnava reformer, accorded to Holeyas the privilege of entering the temple along with the Brahmans and other higher castes during the annual car-festival for a period of three days. The privilege of entering the temple during the annual car procession is enjoyed by the Holeyas in the Vishnu Temple at Belur, Hassan District. The Medas (6,778) do not enter the inner portions of a temple.
- (8) *Pollution.*—(a) *By touch.*—The Bedas are generally considered as low caste people and therefore the Brahmans and other 'Dwijā' or 'twice born' classes do not touch them. The touch of a Nayinda is supposed to defile a Brahman, a Komati and men of some other similar castes.
- (b) *Within a certain distance.*—The close presence of Holeyas and Madigas is thought to cause pollution.
- (9) The following castes '*bury their dead.*'—
 Agasa, Beda, Golla, Holeyā, Idiga, Jogi, Lingayat, Madiga, Meda, Nayinda, Neygi, Vakkaliga and Vodda. But corpses of lepers and pregnant women are either cremated or buried in heaps of stones, among Agasas; persons suffering from leprosy and other cutaneous diseases are cremated among Bedas; old or esteemed people among Bestas (156,863), old people among Holeyas; those killed by wild animals, pregnant women and lepers are either cremated or buried in heaps of small stones by Voddas.
- (10) Bedas '*eat beef*'; but some do not eat cows and buffaloes. Madigas partake of the carcasses of cattle.

Chitaldrug 10 per cent, each, Shimoga 9, and Kadur 6 per cent, of the Hindu population of the State.

Religion			1871	1881	1891	1901	1911
Total population	10,000	8,281	9,779	10,957	11,485

Other religions	2

89. The statement appended gives the figures for each district and city for the two Censuses and the percentage of increase or decrease during the decade. The cities of Bangalore and Civil and Military Station, Bangalore, were thinly populated in 1901 as plague was very prevalent then. So the increases are above the normal for the Hindu population of the State, i.e., 4·7 per cent. It is noteworthy that the increase in Bangalore City is +27·5 per cent. The increase is due both to immigration and to natural growth. The increase in the Kolar Gold Fields is likewise due to immigration and natural growth on account of the expansion of the gold mining industry in the area. Chitaldrug District has received during the decennium an increase of area from the Kadur and Tumkur Districts containing a population (1901) of 12,267 persons and so the increase appears so high as +12·9. The Hindu population of Districts having a percentage of variation lower than that for the State (4·7) will now be examined. It is noticeable that in the Mysore District the decreases in Seringapatam (-6·8), French-rocks (-3·0) and Yelandur (-3·3) account for the small variation of +3·8. In Hassan District the decreases in Manjarabad (-15·4), Belur (-7·2) and Alur (Snb) (-8·1) have brought down the district increase to +1·9. In Kadur District there is a general decrease except in the Kadur Taluk (which was the unit that gave a population of nearly 3,500 to Chitaldrug District). The decrease varies from -9·2 in Chikmagalur Taluk to -2·6 in Koppa. In Shimoga District there is a decrease except in the taluks of Shimoga, Channagiri and Honnali, the decreases varying from -9·9 in the Kunsi Sub-Taluk to -1·9 in Shikarpur. Hinduism has received an accession by some Animist tribes returning themselves as Hindus in this Census, so that in the case of some taluks the natural increase of Hindus would be slightly less and the natural decrease more noticeable than now denoted in Provincial Table II.

The growth of the numbers of Hindus during 1901-11.

District or city			Hindus in		Percentage of variation
			1911	1901	
Bangalore City	72,632	56,975	+27·5
Bangalore District	691,148	659,711	+ 4·8
Kolar Gold Fields (City)	35,395	29,019	+22·0
Kolar District	671,167	634,921	+ 5·7
Tumkur District	683,971	633,847	+ 7·9
Mysore City	55,926	52,495	+ 6·5
Mysore District	1,225,397	1,180,463	+ 3·8
Chitaldrug District	524,169	464,092	+12·9
Hassan District	551,669	541,531	+ 1·9
Kadur District	309,627	326,960	- 5·3
Shimoga District	463,261	468,435	- 1·1
Civil and Military Station, Bangalore	56,546	50,727	+11·5

Musal-
mans.

90. The statement appended in the margin shows taluks with large numbers of Muhammadans in the districts of the State. The urban Muhammadan population forms more than one-third of the total Muhammadan population and consists mostly of artisans and traders. The return of Tribes (Imperial Table XIII), contains such names as Saiyid, Sheikh, Sharif and Hanifi which return 235,378 persons or 75 per cent, of the total population. The foreign tribes such as Awan, Gujar, Jat, Labbai, Mapilla, etc., who are more or less sojourners may be left out of account in tracing the growth of the indigenous population. The Mughals (8,151) and Pathans (44,689) seem to be the only numerous indigenous tribes probably descended from the Dekhani Musalman adventurers who hailed from Bijapur after the disruption of the Vijayanagar Kingdom in the 16th. Century. The

Mughal occupation towards the end of the 17th Century of Sira meant a good deal and the extensive conversions of Tippu Sultan were responsible for the addition of numbers to Muhammadanism in the 18th Century. It may be herein noted that most of the Muhammadans in the State belong to the sect of Sunnis.

Chris-
tians.

91. Fully seven-tenths of the Christian population are urban. Of this urban population, nearly one-half are in the Civil and Military Station, Bangalore, and more than six-sevenths reside in the four cities. The taluks that have over 500 Christians are shown in the statement given in the margin. The growth of the Christians during the decade 1901-11 is +19.5 per cent. The increase in the urban Christian population in the period is 20.8 per cent and that in the rural population is 16.7 per cent. The cities alone have an increase of 23.1 per cent, the rest of the State having an increase of 14.4 per cent. The increase in the cities is 70 per cent of the total increase for the State. The increase though favourable when compared with the general increase in population (4.8 per cent) is less than that of the previous decade (+31.3 per cent). Besides being due to natural causes, the increase of +31.9 per cent in the Bangalore City, of +26.2 per cent in Kolar District and of +37.5 per cent in Kolar Gold Fields is due to migration; of +71.9 per cent in Tumkur on account of the enumeration of the soldiers and followers of two batteries on the line of march on the 10th March 1911; the decrease of 44.7 per cent in Chitaldrug District is due to the closing of the large Public Works on the Marikanave Lake where by a village Chikkanahalli which consisted of 4,544 persons in 1901 (but was unpopulated in 1891) now in 1911 contains only 855 persons.

92. It was only in the case of Christians that the return by sects was pre-
scribed and the information collected showed as follows:—

The sects
of Chris-
tians.

Sect	1911	1901
Total Population	59,844	50,059
Roman Catholic	42,543	37,616
Anglican Communion	6,656	7,797
Other Protestants	9,050	3,851
Armenian	1	...
Syrian	10	8
Sect not returned and indefinite beliefs...	1,584	787

As the co-operation of the heads of the several missionary bodies was requested by a special circular, there is every reason to believe that the information collected is fairly accurate.

The Roman Catholics form nearly seven-tenths of the Christian population. Among the Roman Catholics the natives form 90 per cent, Anglo-Indians 7 per cent, and Europeans 3 per cent. The Catholic Missions began serious work from the 17th century, to let alone the early labours of the Dominicans in the 14th and of the Franciscans in the 16th centuries. Their efforts, though stemmed during the rule of Tippu Sultan, have been very successful, the largest number of native Christians being in their fold. On the other hand, the Anglican Communion contains the least number of natives in its congregation, *i.e.*, 12 per cent, while Europeans number 59 per cent and Anglo-Indians 29 per cent. Considered by sects, the races stand as follows:—

(1) *Europeans* (7,463) are mostly Anglicans (3,955), Roman Catholics (1,469), Presbyterians (1,030) and Methodists (543).

(2) *Anglo-Indians* (5,827) consist principally of Roman Catholics (3,140), Anglicans (1,910) and Methodists (363).

(3) *Indians* (46,554) are chiefly Roman Catholics (37,934), Methodists (2,919) and other Protestants unspecified (1,671). Comparison with the numbers for sects returned in 1901 is not possible as some of the figures specially for Anglicans in 1901 were inaccurate (*vide* para 14 of Mysore Census Report, 1901, page 88).

93. There is a Roman Catholic Bishop for Mysore and there are nearly 100 places of worship in the State. The first Protestant Mission (London Mission) began working from 1820 and there are now the following Missions engaged in work in different parts of the State:—

Christian
Missions
and their
work.

- (1) London Mission.
- (2) Wesleyan Mission.
- (3) American Methodist Episcopal Church.
- (4) Leipzig Lutheran Mission.

- (8) Ceylon and India General Mission.
- (9) The Salvation Army.

Schools and colleges for boys and girls, orphanages, hospitals and asylums for the aged, are provided by the missionaries. The chief work is among the backward classes of Hindus. The enlightening influence of Christianity is patent in the increased standard of comfort of the converts and their sober, disciplined and busy lives. To take education for instance, we find that among Indian Christians no less than 11,523 persons or 25 per cent of the population are returned as literate while for the total population of the State the percentage is only 6. The natural increase of the existing population, and the influx of outsiders to Bangalore on account of the Civil and Military Station there and to the Kolar Gold Fields on account of the expansion of the gold mining industry, are mainly responsible for the increase during the decade.

94. (i) The convert has better chances of education and start in life as an artisan or agriculturist.

Conver-
sion to
Christi-
anity.

(ii) Even if he be in very humble circumstances he can assert his individuality in the Christian fold, which is sometimes not possible in Hinduism.

97. The increase in numbers among Jains is remarkable (28·9 per cent). **Jains.** The community has a history of its own and dates in Mysore from the time of the migration of their great teacher Bhadrabahu southwards and sojourn near Sravana Belgola in the Hassan District. The Jains have left an indelible mark on Kanarese literature. At the present day, the majority of Jains (who are Digambaras) are mostly traders and landlords. The increase is due to natural growth and also to many Sadas (Vakkaligās) in the Bangalore and Tumkur Districts returning themselves as "Jains."⁴ The immigrant Jains (chiefly Svetambaras) are mostly from the Rajputana States and are engaged in trade and money lending. The taluks returning more than 500 Jains in each district are:—Nelamangala and Magadi (Bangalore District), Goribidnur (Kolar District), Tumkur, Maddagiri and Koratagere (Snb) (Tumkur District), Heggaddevankote (Mysore District), Hassan and Channarayana (Hassan District), Mndgere (Kadur District) and Sagar (Shimoga District).

98. The adherents of the Parsi, Sikh, Brahmo and Jew religions are **Other numerically very few.** The Buddhists number 622 in 1911 while they numbered **religions.** 10 in 1901. As the increase is remarkable, a few facts regarding the same may not be out of place here. The increase is most marked in the Civil and Military Station, Bangalore, and the Kolar Gold Fields. The expansion is not due to natural growth or immigration, but to proselytism. There are two branches of the South India Sakya Buddhist Society working at Bangalore (Civil and Military Station) and Kolar Gold Fields respectively. Mission work seems to have begun at the latter place in the year 1906 and at the former in 1909. The disciples belong to the Indian Church of Buddhists which is akin to the Buddhist Church of Burma and Ceylon. The lofty principles and beautifully simple life enunciated by the founder of the religion seem to appeal with peculiar force to the Tamil-speaking artisans and middle classes in the localities mentioned above. In fact, it is learnt that but for the unavoidable absence of the Buddhist priests (who are naturally at this infant stage of their mission, required to be touring to all the branch societies in Mysore and elsewhere in Southern India), many more persons would have received the "Tri Saranam" (three refuges) and the "Pancha Sila" (five precepts) which ceremonial is necessary for admission into the fold of the Buddhist Church. This initiation consists in the disciple asking and receiving the vows (i.e., Tri Saranam and Pancha Sila) at the hands of a Buddhist priest. These vows are (as translated into English):—

(i) Tri Saranam (three refuges)—

- (a) To the Buddha I go for refuge.
- (b) To the Law I go for refuge.
- (c) To the Order I go for refuge.

(ii) Pancha Sila (five precepts)—

- (a) I promise to abstain from taking or destroying the breath, the energy or the life of any human being.
- (b) I promise to abstain from taking anything that belongs to another with thievish intention.
- (c) I promise to abstain from unlawful indulgence of the bodily passion.
- (d) I promise to abstain from uttering (even) a word of falsehood.
- (e) I promise to abstain from partaking of anything which will tend to produce drunkenness.

Conversion does not seem to necessitate any change either in the social life or in the civil law followed by the disciple. This renaissance of the Buddhist movement is full of interest and future promise. The usual thorny questions incidental to proselytism, *viz.*, those relating to inheritance and marriage have not yet disturbed the peace of the young community.

There has been an increase of Brahmos in the Bangalore City and Civil and Military Station, Bangalore. The Samaj here belongs to the 'Sadharan' section. The numbers include local converts as well.

99. For every 1,000 males there are 986 females among Hindus, 897 among Muhammadans, 879 among Christians, 877 among Jains and 951 among Animists.

Proportion of females to males in the main religions.

* NOTE.—The following note occurs against the caste in the Mysore Census Report, 1871:—'The whole tribe appear originally to have been Jains but are now divided into three classes according to the religion they follow. They are worshippers of Vishnu, Siva and Jainesvara. All of them eat together and intermarry; the wife, as usual in such cases, adopts the religion of her husband.'

PART II.—GENERAL.

The actual religious beliefs of the Hindu villager.

100. As Hinduism is a religion which gives scope for a variety of beliefs, the ordinary Hindu villager's religious beliefs, what with the usually precarious nature of the yearly monsoons, consist mainly of notions which suggest to him the necessity of placating unseen potent influences which on the whole seem to work against him. Unlike the Duke in Shakespeare's 'As You Like It,' he does *not* find

"Books in the running brooks,
Sermons in stones, and good in everything."

Whether it be the permanent village deity (Gramma Devata) or the visiting Maramma of plague, cholera, drought or famine, the idea is clear, *viz.*, that of appeasing her wrath by general feeding and sacrifices. Buffaloes, sheep and goats are generally sacrificed in public celebrations and sheep or fowls in family celebrations. The important occasions connected with agriculture, *e.g.*, the beginning of the ploughing season and the harvest home, are celebrated with feasts, sacrifices being offered in the usual way to keep the wrathful gods at peace. Resort to astrologers who generally advise a shift from the dwelling or a local pilgrimage or feeding and sacrifice, or reference to one versed in incantations to drive out the evil, is invariably had in emergencies such as the obsession of a devil or a predeceased co-wife or death on an unlucky day. It is only when these placative resources are exhausted that the ordinary villager becomes resigned to his lot.—"Whatever will be, will be." Anything grand or imposing or awe-inspiring or out of the way, *e.g.*, a mansion, a big tree, a lonely cave, a natural spring, is at once thought of as having a spirit which must be placated in order to keep it from crossing one's path. Coigns of vantage in natural scenery are almost always found capped with rough mantaps within which are Gods consecrated to the spot. This pessimistic temperament is softened by the two ideas of contentment and clarity that run through the villager's whole nature. These grand qualities may be said to be the legacy of the Aryan civilization.

Forms of worship among Hindus.

101. (a) The Brahmans and the other high castes, resemble one another in ritual observances. A Brahman must bathe and offer his prayers to the Sun thrice a day. If he is a householder, he must worship his Gods Ganapathi, the Siva Linga, Saligram, Nag and the *pada* of Vishnu according to the sectarian views of the worshipper, every day himself or by a member of the same family or by a paid Brahman. A Brahman has to do five things daily according to the orthodox rule—study the Vedas, offer libations to Gods, welcome guests, offer water to departed ancestors and give food to animals. The study is gone through by repeating the important texts of the scriptures. The chief Gods, preceptors and teachers (and also the ancestors in the case of persons who have lost their fathers) are remembered, oblations of water being offered the while. Periodically the feasts come round to commemorate some incident in the life of the great Gods, *e.g.*, Gouri, Ganesha, Krishna Jayanti, the anniversary of departed teachers or the remembrance of the primeval life led by the Brahmans, *e.g.*, Sravani or the national festival, *viz.*, the Dasara, when the monsoons are closing for the year. Special ceremonies are performed when he is anxious for a special favour, *e.g.*, cure of a disease or success in a particular undertaking or when a calamity is impending. Such ceremonies take the form of pilgrimages and special prayers to Gods, *e.g.*, the Sun or the nine planets (Grahās). Tending the 'Tulasi' plant is a religious observance specially looked to by the women of the household. The rearing of the 'ficus religiosa' and neem tree with a platform round them is considered a pious act by all castes. This is so very common that almost every village has two or three platforms in the midst of which the stately ficus and the garbed neem rear their rustling foliage.

(b) The lower Hindu castes. Periodical and special worship is resorted to by the lower castes, daily worship being the privilege, so to say, of the cultured and higher classes. The periodical worship varies more or less with the profession of the devotee and special worship with the object sought to be attained. At the great festivals and the domestic occurrences the Gods, family Gods and ancestors are worshipped and propitiated and there is a general feeding. The degree and comprehensiveness of the worship are often determined by the social rank of the head of the family and the nature of the occasion.

(c) The ideas and practices regarding household worship and pollution (*vide* para 87 *supra*) are slowly disintegrating owing to the growth of scientific knowledge, the conditions of modern travel, and the stress of competition in all walks of life.

102. In domestic and daily ceremonial many of the higher castes desire the presence of the Brahman or set apart his share of gifts before they begin. In communal or special worship, *e.g.*, to Maramma or Grama Devata, the officiator is most often not a Brahman. On such occasions Brahmans contribute to the general worship even though a Brahman is not the officiator. For most temples in villages the priest is a Satani or Vaishnava who does not wear the sacred thread. To certain 'Grama Devatas' and 'Marammas' the priest or spokesman is of other castes and sometimes a Madiga or Holeyā. Hindu
priests.

103. With the exception of the Mughals and Pathans who may be regarded as descended from the Dekhani Musahnan immigrants from Bijapur in the 17th century, of Dayares from Hyderabad and the immigrant tribes of Labbai and Mapilla on the one hand and Arah, Gujar, Jat, Meman, etc., on the other, the rest seem to be the descendants of the local converts. There are not many conversions now-a-days; the Hindu customs, etc., do not survive among the converts; but the idea of the Hindu Joint Family seems still to prevail in the minds of the Muhammadans in the rural tracts. Muham-
madans.

CHAPTER V.

AGE.

104. Although statistics of classification by age are to be found in Imperial Tables VII, VIII, XII, XIV and XVIII, they are confined to the literate in Table VIII, to the infirm in Table XII, and to Christians in Table XVIII; and as such these will be discussed elsewhere in the chapters specially devoted to the respective subjects. In Table VII, the entire population is distributed by religion, age, sex and civil condition, while Table XIV exhibits a similar classification by age, sex and civil condition for each caste with, however, a different scheme of age-grouping from that adopted in Table VII. The figures in these two tables, so far as they relate to sex and civil condition, will be chiefly dealt with in the next two chapters. The scope of the present chapter will thus be confined to a discussion of the statistics of age-distribution contained in Tables VII and XIV supplemented by vital statistics furnished elsewhere in annual departmental reports, with a view to draw therefrom useful or interesting inferences regarding the longevity and fecundity of the people, as well as changes, if any, that might occur in their age-distribution from time to time.

Reference
to statis-
tics.

There are 19 age-groups exhibited in Imperial Table VII, *viz.*, one for each year of life up to 5, and one for each quinquennial period thereafter up to 70, with a single head for persons aged 70 and over. The same scheme of age-grouping was also adopted in Table VII of the Census of 1901 except that the quinquennial periods then went up only to 60, leaving a single final age-group '60 and over.' In Imperial Table XIV, the ages are shown in six groups as in the Census of 1901 and they are 0-5, 5-12, 12-15, 15-20, 20-40 and 40 and over. The main features of the statistics contained in these tables and of the vital statistics referred to above are exhibited in the following Subsidiary Tables appended to this chapter:—

- (i) Age distribution of 100,000 of each sex by annual periods.
- (ii) Age distribution of 10,000 of each sex in the Province and each Natural Division.
- (iii) Age distribution of 10,000 of each sex in the Province in each main religion.
- (iv) Age distribution of 1,000 of each sex in certain castes.
- (v) Proportion of children under 10 and of persons over 60 to those aged 15-40; also of married females aged 15-40 per 100 females.
- (vi) Variation in population at certain age periods.
- (vii) Reported birth-rate by sex and Natural Divisions.
- (viii) Reported death-rate by sex and Natural Divisions.
- (ix) Reported death-rate by sex and age in decade and in selected years per mille living at same age according to the Census of 1901.
- (x) Reported deaths from certain diseases per mille of each sex.
- (xa) Reported deaths from plague per mille.

105. The instructions issued to enumerators for filling up the age column in the general schedule were the same as in 1901 and were as follows:—

"Enter the age on last birth-day, *i.e.*, the number of years each person has completed. For infants less than one year old, enter the word "Infant." If a person cannot state his or her age exactly you should ask the relations or refer to some well-known event of local importance, or if the person be present, make a guess at the age from the appearance."

Age sta-
tistics
how far
reliable.
Their uti-
lity.

It cannot be denied that the enumerators who were mostly Government officials exercised all possible care and diligence in ascertaining and recording the ages of the people. Still there are certain inevitable features detracting from the accuracy of the age return. For one thing, it is rare for an average person to be able to give out his *exact* age off-hand, for the simple reason that for the masses the annual variant of a numeral denoting age does not figure prominently or frequently in the daily transactions of life so that it matters little for them to be ignorant of their exact age to the niceties of a few months or even years. Horoscopes and similar records of birth are maintained only among an extremely small minority of the population, and even in such cases, people do not surely think of referring to them when they are asked to state their age. The annual celebration of birth-days would, no doubt, tend to keep alive one's exact age in one's memory; but such observances are rare indeed. Under these circumstances, the age entered in the Census schedule is very often the result of a guess which betrays, naturally enough, a preference for round numbers or multiples of five. Further, there is the tendency to give out the *current* year instead of the *completed* year of age, to understate the age in the case of grown-up unmarried females and to exaggerate it in the case of old persons and of young married women with children. Subsidiary Table I appended to this chapter will afford interesting study in this connection. The table exhibits the distribution by age (as actually returned in the schedule) of 100,000 persons of each sex among Hindus taken at random in a few typical localities in the State. If the ages had all been correctly returned, one might naturally expect, in a stationary or growing population, the number at each age to go on steadily decreasing as the age advances. But the actual figures in the table disclose some capricious irregularities which may be briefly noticed here.

There is no sharp fluctuation from figure to figure as we pass from age 0 to 10 except for a marked depression against age 1 and a more striking elevation observed in the case of age 8. From 10 onwards, the general rule seems to be that multiples of 5 and 10 are more favoured than their neighbours on either side, while at the same time *even* ages are preferred to *odd* ones, subject, however, to the above rule. The lumping of figures against ages 12 and 16 also deserves special notice. Age 30 claims the largest number in the case of both males and females. All these features are graphically exhibited in the following diagram.

Diagram showing the actual number of males returned at each age per 100,000.

NOTE.—The figures at the bottom indicate the age and those at the side the number of persons returned at it.

The defects noticed above in the age return would appear to be so flagrant that at first sight one wonders what useful purpose can be served by such crude statistics. But in a large population the defects of over- and under-statement of age tend to counteract each other, and as for the tendency to pitch on round

numbers or multiples of 5, this can be partially corrected by suitable methods of 'smoothing' of age figures. Even then, it is doubtful if a high standard of accuracy is attainable; but in any case, in the present imperfect state of our vital statistics, these age returns afford the only means of check and verification and thus constitute an indispensable auxiliary to vital statistics for the purpose of drawing fairly reliable inferences regarding birth- and death-rates, the expectation of life at different ages and the effects of famine or other public calamities that might be traced in variations in the age-distribution of the population from time to time.

106. Although the age-distribution of the population is mainly determined by the normal birth-and death-rates, there are also other disturbing factors such as famine and migration that have to be taken into account. Not only does famine swell the death-rate for the time being, but it also leads to far-reaching fluctuations in the age-distribution of the people in the succeeding decades, as will be clear from the following extract taken from the India Census Report of 1901 (para 752, pages 474-5):—

Factors affecting age-distribution.
(i) Famine.

"When a tract is afflicted by famine . . . all sections of the population, however, are not equally affected: the very old and the very young suffer most while those in the prime of life sustain only a comparatively small diminution in their numbers. . . . Consequently at the close of a famine, the population consists of an unusually small proportion of children and old persons and of a very large proportion of persons in the prime of life i.e., at the reproductive ages. For some years, therefore, in the absence of any fresh calamity, the growth of the population is very rapid. The number of persons capable of adding to the population not having been much affected, the actual number of births is very little less than before the famine, but the proportion calculated on the diminished population is much greater, and so too is the excess of births over deaths, as the latter are much below the average of a population consisting of an unusually large proportion of healthy persons in the same age, and of a comparatively small proportion of persons who by reason of youth, infirmity or infirmity have a relatively short expectation of life. This more rapid rate of growth continues for some years, but then as the persons who at the time of the famine were in their prime pass into old age and their place is taken by the generation born shortly before the famine with its numbers greatly reduced by the mortality which then occurred, the birth-rate falls, not only below that of the years following the famine, but also below the average. The disturbance of the normal conditions is still not ended, and the pendulum continues to swing backwards and forwards between periods of high and low birth-rate, but its oscillations gradually become fainter until they cease: the natural causes to be apparent or, as more often happens, until some fresh calamity obliterates them."

The above remarks will find illustration later on in para 108 where the figures of the Censuses are discussed and reference is made to the famine of 1876-77.

107. Then there is the disturbing effect of migration. As people who leave their homes for distant lands will mostly consist of adults, their departure will tend, if their number is sufficiently large, to reduce the proportion of the middle-aged and raise that of children and old persons in the population of the tracts from which they go, and produce an opposite effect in the age-distribution of the population of the country that receives them. Immigration and emigration have thus counteracting tendencies, and it is therefore the actual difference between the number of immigrants and of emigrants that may be roughly considered as determining the disturbing factor. Taking the Mysore State as a whole, the total number of immigrants (i.e., those born outside Mysore and enumerated in Mysore) is 312,908, while the emigrants from Mysore who have gone to other parts of India and Ceylon number 139,446. Although we have no information regarding the number of those who have left Mysore for other parts of the world, we may estimate this at a comparatively low figure. In any case, it will be a safe approximation if we take the excess of immigrants over emigrants as 170,000. This comes to nearly 3 per cent of the total population of Mysore and as such its influence over the age-distribution of the population cannot be altogether ignored. It must, at the same time, be admitted that in the absence of statistics to show the age-distribution of immigrants, it is not possible to frame any accurate measure of the disturbing influence of migration. But as a special table was compiled as regards birthplace, caste, age* and occupation of immigrants in

(ii) Migration.

* Only three age-periods were distinguished, viz., 0-15, 15-40, and 40 and over.

a limited area (*viz.*, Bangalore City and Kolar Gold Fields) a fair idea of the sub-

	Number per mille aged		
	0-15	15-40	40 and over
1. Population of the whole State ...	371	392	234
2. Do Bangalore City and Kolar Gold Fields (City) ...	332	474	194
3. Do Bangalore City and Kolar Gold Fields, excluding immigrants ...	432	365	203
4. Immigrants in Bangalore City and Kolar Gold Fields (City) ...	230	585	185

ject can be formed from the marginally noted comparative statement showing the age-distribution of (a) the total population of the Mysore State, (b) the total population of Bangalore City and Kolar Gold Fields and (c) the immigrants only in these two cities.

Age-distribution.

109. Subsidiary Table II exhibits the age-distribution of the population in 1911 as well as in the three previous Censuses. Let us first take up the figures relating to the Census of 1911. It is curious to find that, contrary to the natural law of age-distribution obtaining in a progressive or stationary population, persons aged 5-10 in each sex outnumber those aged 0-5. This must have been due to the inaccuracy in the age return owing to the circumstance that persons who have completed their 4th year of age but not the 5th are often erroneously shown as aged 5. Another remarkable feature is the excess of females aged 20-25 over those aged 15-20, which is observable in all the Censuses. This has to be explained on the one hand by the tendency to mention young (aged 15-20) married women with children as older than they really are, and on the other by the disposition to understate age in the case of unmarried females aged 15-20, so that the number returned for the age-group 15-20 suffers a decrease in both ways. A tendency to exaggerate age in the case of old persons is likewise traceable in the excess of males aged 60-65 over those aged 55-60 and of females aged 50-55 over those aged 45-50. It is rather difficult to account for the fact that the age-group 40-45 claims more people in each sex than the earlier period 35-40. Perhaps one has to be content with the observation that, ordinarily, beyond 25 or 30, the older the individual the greater is the margin of error in the age as returned in the schedule. It may, however, be pointed out that in 1881 also the number of males aged 10-15 exceeded those aged 5-10 and their survivors in 1911 would be comprised in the above age-groups 40-45 and 35-40 respectively.

A comparison of the figures for the last four Censuses reveals unmistakable traces of the famine of 1876-77. Taking only the case of males as their ages are likely to be more accurately returned than those of females, it will be noted that in 1881, close after the famine, the proportion of children aged 0-5 was considerably reduced, with a similar shrinkage in the age-groups comprising their survivors in the next three Censuses, *viz.*, 10-15 in 1891, 20-25 in 1901 and 30-35 in 1911. So also is the rebound after famine visible in the large proportion of children aged 0-5 in 1891 and a perceptible increase due to the inclusion of their survivors in the age-group 10-15 in 1901 and in 20-25 in 1911. The statistics relevant to the subject are exhibited in the marginal statement where the inflated and reduced figures are shown in italics and marked (a) and (b) respectively.

a mere mathematical abstraction determined by the nature of age-distribution in the population. A high mean age may be due to general longevity of the people or a low birth-rate or high death-rate among children. Similarly, a low figure may indicate either that the people are comparatively short-lived or that they are very prolific and multiplying rapidly. The mean age, as shown in Subsidiary Tables II and III, has been calculated from the figures of Imperial Table VII according to the following formula :—

Where ages have been tabulated by five-year periods only (as in Imperial Table VII) find out the total number of persons living at the close of each age-period. The sum of these totals, multiplied by five and raised by two and a half times the actual number of persons comprised in the population, should be divided by the last-mentioned number of persons.

110. In discussing the variations in the mean age of the population in the past Censuses, it will be sufficient to confine our consideration to the male sex inasmuch as the age return for males is likely to be less inaccurate than in the case of females. Taking, then, the entire male population of the Mysore State including the Civil and Military Station of Bangalore, the mean age has steadily risen from 1881 to 1911 as may be seen from the marginally noted figures. This is due, on the one hand, to the continued decline in the proportion of children under 10 years from 1891 to 1911, and on the other, to the uninterrupted growth in the proportion of old persons aged 60 and over ever since 1881 onwards. The low proportion of children in 1881 may at first sight lead one to expect a relatively high mean age in that Census, but this factor is more than counterbalanced by the abnormally small proportion of old persons in the same Census, both being the result of the severe famine of 1876-77 already referred to in a previous paragraph.

Last four Censuses.

Year	Mean age
1881 ...	21.5
1891 ...	21.9
1901 ...	25.0
1911 ...	25.9

111. The mean age in the Eastern Division stands higher than in the Western. It will be seen from Subsidiary Table II that the proportion of children under 10 years, as also of persons aged 40 and over is greater in the former Division. This may be attributed to the higher birth-rate and lower death-rate in that Division as evidenced by Subsidiary Tables VII and VIII. People are apparently more favoured with longevity in the Eastern than in the Western Division.

Natural Divisions.

112. To bring out the salient features of variation in the age-distribution of the population in different districts and cities, the marginal tabular statement has been prepared to show the number of persons per mille aged 0-15, 15-50 and 50 and over respectively.

Districts and cities.

the cities themselves, the lowest proportion is found in the Mysore City and the highest in Kolar Gold Fields where the so-called 'onerous' population, i.e., the young and the old, may naturally be expected to stand at a very low figure owing to the exigencies of the local mining industry.

Among districts, Kadur stands first with 545 and Tumkur last with 480. The high proportions in Kadur and Shimoga Districts are mainly due to the comparatively short duration of life obtaining generally in the case of people in the *malnad*.

Taking the age-period 15-50, it will be seen that the four cities exhibit proportions ranging from 520 to 624 per mille, which are all much higher than the average for the State as a whole, viz., 497. This does not call for any explanation as the middle-aged persons are usually in a higher proportion in the cities than in rural parts. As among

In this connection it may be observed that M. Sundbarg, Deputy Director of the Central Statistical Bureau, Stockholm, pointed out in an address delivered by him before the International Statistical Institute at Christiania that in almost all countries the proportion of persons aged 15-50 to the total population is uniformly about half. This was supported by statistics for almost all the countries of Europe and also United States, Australia and Japan, the proportion ranging from 492 to 509 per mille in these countries. It is evident that this standard cannot be expected to be always conformed to in a country like India where the age-distribution of the population is liable to rude disturbances from periodical visitations of famine which carries away a large number of victims at the extreme ages of life, *i.e.*, of very young and old persons. For instance in the Mysore State which suffered severely from the famine of 1876-77 the proportion of persons aged 15-50 was so high as 535 per mille in 1881, *i.e.*, soon after this famine. It went down to 515 in 1891 and fell still further to 473 in 1901, but more or less recovered its normal position in 1911 when it stood at 497. It may perhaps be expected that, in the absence of disturbances caused in age-distribution by famine, the age-period 15-50 would ordinarily comprise about one-half of the total population.

Taking up next the age-period 0-15, the proportion is naturally lowest in the Kolar Gold Fields, as already explained, and highest in the Chitaldrug District which likewise exhibits the largest percentage of increase in population from 1901 to 1911 (*vide* Subsidiary Table I of Chapter II). The number of old persons aged 50 and over is proportionately least in Kadur District and greatest in Kolar District.

Religions.

113. Among the different main religions, the mean age is highest for 'Jain' and lowest for 'Christian.' The other three religions, *viz.*, Hindu, Animistic and Musalman come between these two in the order named. This was almost the same order as in 1901 except that the 'Musalman' and the 'Animistic' have changed places in 1911 owing to the larger proportion of persons aged 40 and over among the Animists in 1911. Taking the entire population, *i.e.*, of all religions together, the mean age in 1911 works out to 25·9 for males and 25·3 for females. The mean age for 'Hindu' and 'Jain' is higher than the above average while that for the other three main religions falls below the same (*vide* marginal statement). In discussing the relative age-distribution of the population as among the adherents of different religions, we may, as in para

Religion	Mean age in 1911		Mean age in 1901	
	Male	Female	Male	Female
Hindu ...	26·0	25·4	25·0	25·6
Musalman ...	25·1	23·8	24·3	24·1
Christian ...	24·7	23·5	23·6	23·4
Jain ...	26·6	26·2	26·4	25·8
Animistic ...	25·2	23·9	23·9	23·4
All religions ...	25·9	25·3	25·0	25·5

110 above, confine ourselves to the case of males. Taking first the proportion of children aged 0-10, it is highest among the Animists. Next come the Musalmans, Hindus and Christians in order, and last the Jains. It may as well be remarked that the relative fecundity as among the different communities does not necessarily follow the same order. Taking the ratio of children aged 0-10 to married women aged 15-40 as a rough and ready measure of relative fecundity, the above five religions stand as in the margin.

Religion	Number of children under 10 years per 100 married females aged 15-40
Hindu ...	162
Musalman ...	182
Christian ...	182
Jain ...	156
Animistic ...	175

As regards old persons aged 60 and over, the Animists again claim the highest proportion, Hindus, Musalmans, Jains and Christians following in the order named. It is remarkable that the Animists who had only 441 per 10,000 males aged 60 and over in 1901 have gone up to 597 over the heads of other communities in 1911. In fact, they possess the largest proportion of persons at both the extreme periods of life, *viz.*, at the age-periods 0-10 and 60 and over. Their ranks are thus considerably thinned in the middle of life and this is not evidently favourable to a large rate of increase among them in the next decennium. It is strange that the figures of the recent Census should point to them as the most favoured from the standpoint of longevity, although they were considered as comparatively shortlived in 1901. It may perhaps be suggested that the age

return would have been distorted by the usual tendency of exaggerating the age of old persons in a specially marked degree among this backward section of the population. But this explanation is not adequate to bridge the wide gulf that exists between the proportion of persons aged 60 and over among the Animists in 1901 and that in 1911. It is at the same time not prudent to infer merely from these figures that the Animists have considerably improved in longevity in the course of the last decade. As between the Hindus and the Musalmans although the former can boast of a higher proportion of persons aged 60 and over, the Musalmans cannot be said to be inferior to them in regard to longevity; for,

their smaller proportion of old people is partly due to their larger proportion of children. In fact, if we leave children out of account and calculate the proportion of persons aged 60 and over to those aged 10 and over, the Hindus fall below the Musalmans (*vide* marginal figures). As regards Christians, although they have the lowest proportion of persons aged 60 and over, it cannot be inferred that they are short-lived as compared with other religions. They form a young and rapidly growing community and their ranks are being recruited by immigrants and converts on the right side of life so that the age-distribution of the Christian population presents a special feature.

The distribution of males of each religion under the three age-periods 0-15, 15-50 and 50 and over is exhibited in the margin as it may be of some interest in connection with the remarks contained in para 112 above.

Table VII
Proportion of persons aged 60 and over to those aged 10 and over

Religion	Proportion
----------	------------

Religion	Proportion
----------	------------

Religion	Proportion
----------	------------

114. Subsidiary Table IV exhibits the age-distribution of the population belonging to a few selected castes, tribes or races. It will be seen therefrom that the proportion of children aged 0-5 is highest among the Lambanis, while the Indian Christians take easily the first place as regards the age-period 15-40. Examining the proportion of persons aged 40 and over among the several castes, it will be found that the first six places as regards males are taken up by Golla, Banajiga, Nayinda, Boda, Brahman and Ganga, and, as regards females, by Brahman, Banajiga, Golla, Ganga, Kshattriya and Nayinda, so that, considering both the sexes, it may be said that the Banajiga, Brahman, Golla, Ganga and Nayinda are comparatively long-lived. The low proportion of persons aged 40 and over among the Animistic Lambanis points to their relatively short duration of life. But a similar inference with regard to Indian Christians who possess in fact the lowest proportion of old persons, is not permissible in the light of the remarks made in the previous para concerning the special nature of age-distribution among the Christians in general, of whom Indian Christians form nearly 78 per cent.

115. The mean age for the entire population comprising both sexes, calculated as in para 109 above from the figures contained in Imperial Table VII, comes to 25.6. This would roughly represent the mean duration of life if the population had been stationary for some time. But as it is actually progressive, the mean duration of life should be pitched somewhat higher. Let us then take it hypothetically as 27. The average death-rate will then be $\frac{1000}{27}$ or 37 per mille per annum, and assuming the normal annual rate of increase of population as 6 per mille, the birth-rate comes to 43. A perusal of Subsidiary Tables VII and VIII will show, however, that the recorded birth- and death-rates average only 17 and 20 respectively. This would indicate that the registration of vital statistics is very imperfect and that omissions occur more largely in the case of births than of deaths. A comparison of the total number of recorded births in 1910 with the number of children under one year found in Imperial Table VII reveals likewise considerable omissions in the registration of births, the two figures being respectively 97,481 and 143,543. Even if we compare the total recorded births in the five years 1906-10 with the number of children aged 0-5 according to Imperial

Total number of births in the five years 1906-10

Number of children aged 0-5 according to Imperial Table VII

497,830

629,174

Table VII (*vide* margin), the latter is found to exceed the former although it should in fact be considerably less on account of the high mortality among children.

Castes.

Birth- and death-rates.

The registration of vital statistics being thus admittedly imperfect, it is not profitable to discuss at any length the figures contained in Subsidiary Tables VII to X. It may be remarked, however, that so far as these figures go, they point to a higher birth-rate and a lower death-rate in the Eastern than in the Western Division. Also on a comparison of the figures for the ten years ending with 1910, it will be observed that the birth-rate was highest in 1908 which followed a year of agricultural prosperity while the maximum death-rate occurred in 1901 when plague claimed a large number of victims and the country was also suffering from deficient rainfall and, in parts, from severe drought. As regards the death-rates prevailing at different ages, it will be seen from Subsidiary Table IX that the period of least risk in the case of males is 10-15, the death-rate rising steadily on either side of this age-period. For females, mortality is at the lowest ebb in the age-period 5-10 although this distinction is almost equally shared by the next period 10-15. It is noteworthy that in the case of females, the death-rate at the age-period 15-20 is higher than at '20-30' which again is exposed to greater risks than the next higher age-period 30-40. These features which are peculiar to the fair sex are presumably attributable to pregnancy and parturition.

Urban-
birth-rate.

116. The recorded birth- and death-rates are found to be much higher in urban than in rural areas. It is not easy to make out how far this corresponds to actual facts and how far the apparent disparity is due to more satisfactory registration of vital statistics in towns. The only available Census figures that can throw any light on this subject are those relating to children and married women of child-bearing age in the four cities for which statistics are separately given in Imperial Table VII. It will be seen from column 14 of Subsidiary Table V that the proportion of married females aged 15-40 is comparatively higher in the cities so that the birth-rate calculated on the basis of total population may also be expected to be higher in cities. It does not follow, however, that the fecundity of women in cities is necessarily greater than in rural parts. In fact, column 5 of the same Subsidiary Table shows that fecundity as indicated by the proportion of children to married women of child-bearing age is relatively low in the three cities of Bangalore, Kolar Gold Fields and Mysore, while the higher figure for the Civil and Military Station, Bangalore, is attributable to its specially large proportion of Musalmans and Christians who are presumably more prolific than Hindus (*vide* para 113 above).

Married
women of
child-
bearing
age.

117. The proportion of married women of child-bearing age also comes up for consideration in several other ways. For instance, leaving alone the imperfect nature of registration of births, the higher birth-rate (17.6) recorded in 1910 as compared with 1901 (15.5) corresponds in a way to a similar rise in the proportion of married women aged 15-40, the number of such women per 100 females of all ages being 31 in 1911 as against 29 in 1901. Let us next see how far the proportion of fertile women among the different religionists corresponds to the rate of growth in their numbers during the last decade. From the

Religion	Number of married females aged 15-40 per 100 females of all ages (1901)	Percentage of increase in 1901-1911
Hindu	29	+1.7
Jain	29	+28.9
Animistic	30	-16.7
Hindu, Jain and Animistic	29	+3.4
Musalman	30	+8.6
Christian	27	+19.5

three allied religions put together and are shown in italics in the statement. In the case of Christians, the explanation for disparity in the figures in columns 2 and 3 will be found, as already referred to in para 113, in the fact that, besides births, immigration and conversion from other faiths are responsible for a considerable portion of increase in their numbers.

A similar attempt to correlate the rate of growth with the proportion of married women of child-bearing age among the different castes has not yielded any useful results and it is therefore considered unnecessary to reproduce the long array of figures here.

marginal statement, it will be seen that, except perhaps in the case of Musalmans, there is no apparent correspondence between the figures in columns 2 and 3. The abnormal figures for Jains and Animists in column 3 can only be accounted for by the shifting and elusive nature of classification as between them and the Hindus, so that figures have also been calculated for all these

118. It has already been mentioned that the recorded birth- and death-rates are impossibly low on account of defective registration of births and deaths. It is therefore necessary, in comparing Mysore with European countries in this respect, to take the probable true rates as arrived at in para 115 from the mean age

Compared with European countries.

Country	Birth-rate in 1908	Death-rate in 1908
Sweden ...	25.7	14.9
Norway ...	26.2	14.3
Denmark ...	28.7	14.7
Holland ...	29.7	15.0
Belgium ...	21.9	16.5
Germany ...	32.0	18.0
Switzerland ...	27.1	16.2
England ...	26.5	14.7
Scotland ...	27.2	16.1
Italy ...	31.4	22.6
Spain ...	31.2	21.0
France ...	20.2	19.0
Ireland ...	23.3	17.6

of the population in Mysore. The birth- and death-rates were thus estimated at 43 and 37 per mille respectively. It will be seen from the marginally noted statistics that these are much higher than the birth- and death-rates obtaining in European countries, while the excess of birth-rate over death-rate in all those countries except France and perhaps Ireland, is considerably greater than in Mysore. Thus while we have here a more rapid succession of generations than in European countries, the population in those countries is increasing at a higher rate. Their mean duration of life, too, is considerably longer. The explanation for these

differences has to be sought in the varying nature of physical and social environments. It is generally urged that the system of early marriages is not conducive to a high degree of fecundity of women in

Country	Number of births per mille of married women of age 15-45
Sweden ...	268
Norway ...	301
Denmark ...	259
Holland ...	321
Belgium ...	252
Germany ...	285
Switzerland ...	266
England ...	235
Scotland ...	271
Italy ...	260
Spain ...	259
France ...	169
Ireland ...	288

India. Taking the crude birth-rate in Mysore as 43, the number of births per 100 married women aged 15-45 will come to 252. From similar proportions for European countries exhibited in the margin, it will be seen that in spite of a lower birth-rate in those countries, their women are more fertile except in the case of England and France. Even within India itself, the greater fecundity of Musalman and Christian women as compared with their Hindu sisters is partly accounted for by the fact that early marriages are not so common among the former as among the latter.

119. An examination of the monthly figures regarding births during the past four or five years shows that the largest average number of births has occurred in October and that the five months from July to November claim a relatively higher average than the other seven months of the year. The corresponding period of conception may be roughly taken as from October to February; and the reproductive instinct may naturally be expected to be most active during this season when harvests are gathered and the agriculturists who comprise the bulk of the population have a plentiful time of it.

Monthly variation in birth-rate.

CHAPTER VI.

THE PROPORTION OF THE SEXES.

120. Although the distinction by sex is kept up in all the Imperial Census Tables, the scope of the present chapter is mainly confined to a discussion of the proportion of the sexes in the entire population with regard to locality, age-period, religion or caste, and we are here concerned only with the statistics contained in Imperial Tables VII and XIV. The salient features of these and also of extra Census vital statistics relevant to the subject are brought out in the following Subsidiary Tables to be found at the end of this chapter:—

- (i) General proportions of the sexes by Natural Divisions and Districts.
- (ii) Number of females per 1,000 males at different age-periods by religions at each of the last three Censuses.
- (iii) Number of females per 1,000 males at different age-periods by religions and Natural Divisions.
- (iv) Number of females per 1,000 males for certain selected castes.
- (v) Annual number of births and deaths reported for each sex during the decades 1891-00 and 1901-10.
- (vi) Number of deaths of each sex at different ages.

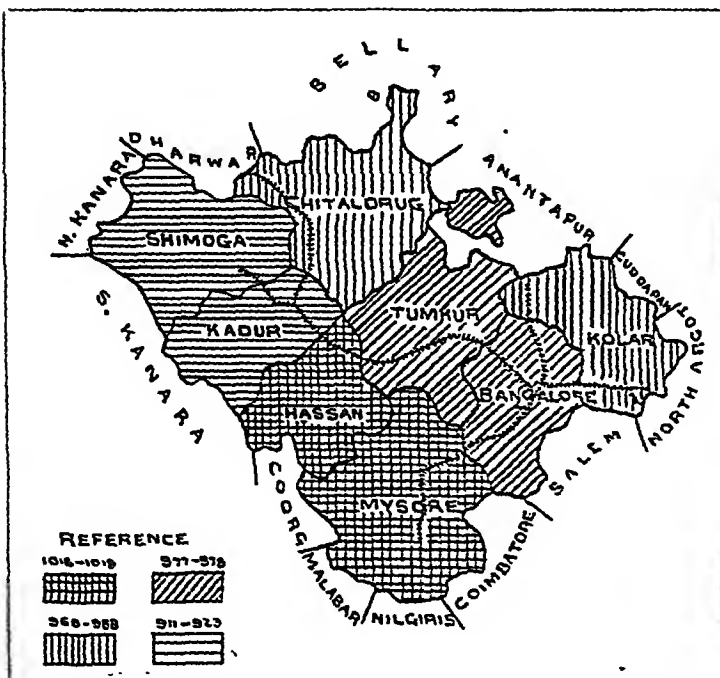

Province, State or Country	Number of females per 1,000 males	<p>121. Taking the population of the whole State, males outnumber females, there being only 979 of the latter for every 1,000 of the former. Similar proportions for a few other Provinces, States and Countries are set forth in the margin as likely to be of interest for purposes of comparison.</p>	<p>Proportion of the sexes. (i) General</p>

122. Within the State itself, the proportion of females is higher in the (ii) Divi-
 Eastern than in the sions and
 MAP OF MYSORE. Western Division, districts.

MAP OF MYSORE.

Showing the number of females to 1,000 males in each district.

Eastern than in the Western Division, their number per 1,000 males being 986 and 958 in the two divisions respectively. It is only in the Mysore and Hassan Districts that females exceed males, while the other six districts show a deficiency of the fair sex. The lowest proportion of females is to be found in the Kadir District. The relative proportion of the sexes in the several districts is graphically shown in the marginal map.

(iii) Cities. 123. Taking the four cities, the proportion of females in every one of them is less than the average for the whole State. It is so low as 739 per 1,000 males in Kolar Gold Fields, the marked deficiency of females being accounted for by the greater demand for male labour in mining operations.

(iv) Taluks. 124. An analysis of the figures indicating the proportion of females in each taluk reveals considerable variations therein, ranging from 744 (females per 1,000 males) in the Koppa Taluk of the Kadur District to 1,108 in the Naga-mangala Taluk of the Mysore District. In the districts of Mysore and Hassan, the only taluks with a deficiency of females are Mysore and Malvalli in the former, and Belur and Manjarabad in the latter. All the taluks in the districts of Chitaldrug and Kadur share in the general excess of males over females. So also is the case in the Tumkur and Shimoga Districts except for the Kunigal Taluk in the former and the Channagiri Taluk in the latter where the fair sex preponderates. In the remaining districts of Bangalore and Kolar, all the taluks except Magadi, Channapatna and Anekal in the former, and all except Kolar, Mnlbagal, Srinivaspur, Chintamani and Malur in the latter share in the general preponderance of males.

Urban and rural.

125. Taking the rural population of the whole State, it contains 983 females for every 1,000 males, while the proportion of females in the urban population is only 942. Viewed also by Natural Divisions and districts, there is a similar disparity in the sex proportions of urban and rural tracts except in the districts of Bangalore and Shimoga, as will be clear from the marginal tabular statement.

Even in the case of Bangalore District, the exception is only apparent; for if the population of Bangalore City is included in the urban population of the district, the proportion of females then falls below that in the rural population. Owing to various kinds of industrial occupations pursued in towns and the large number of immigrants who go there in quest of livelihood leaving their families behind, females will not, as a general rule, figure as largely in urban as in rural tracts. But as most of the towns in Mysore are small and situated in the midst of agricultural tracts without any important industries apart from that of the rural popu-

lation surrounding them, they cannot be strictly considered as urban in their characteristics, so that it is unnecessary to discuss the relative proportion of females in the so-called urban and rural population of each district. The four cities may be really considered as urban tracts, and these have, as observed in para 123 above, a decidedly lower proportion of females than the average for the whole State, thus conforming to the general law.

126. We have hitherto been discussing the proportion of the sexes in the 'actual population,' i.e., persons enumerated in Mysore irrespective of where they were born. Let us now consider the 'natural population' of Mysore, or in other words, those born in Mysore whether enumerated within or beyond Mysore. Although the exact number of persons of either sex born beyond the limits of Mysore and enumerated in Mysore is known from Imperial Table XI, figures regarding emigrants or those born in Mysore and found in other parts of the world are necessarily incomplete. But as the number of Mysore-born persons enumerated in other parts of India is known from the Census statistics of those places and as figures have also been procured by the Census Commissioner in regard to emigrants to Ceylon and a few other likely places beyond India, the omission of those who have emigrated from Mysore to other parts of the world is of too trifling a nature to affect our present discussion. Allowing, then, for naturalization and also for emigration as far as available figures permit, the

Civil and Military Station, Bangalore ...	948	...

proportion of females in the natural population of the State works up to 990 per 1,000 males, as against only 979 in the actual population. There is an excess of males over females among both immigrants and emigrants, the proportion of females to males being considerably lower among the former than among the latter; and as immigrants are more than twice as numerous as emigrants, females are proportionately more deficient in the actual than in the natural population.

It is not possible to calculate the proportion of the sexes in the natural population of each Natural Division or district, as figures received from Provincial Census Superintendents regarding emigrants from Mysore to other parts of India do not make any distinction as regards the different districts of the State where such emigrants may have been born.

127. Arranged according to the proportion of females to males in the enumerated population, the main religions in the State stand in the following order:—Hindu, Animistic, Musalman, Christian and Jain. **Religions.**

Religion	Number of females to 1,000 males
Hindu ...	986
Musalman ...	897
Christian ...	879
Jain ...	877
Animistic ...	951

From the marginal figures, it will be seen that for every 1,000 males there are 35 females less among Animists than among Hindus, while in the case of Musalmans, Christians and Jains, the disparity as compared with Hindus is considerably greater. The low proportion of females among Musalmans and Jains is partly due to the large preponderance of the male sex in the immigrant population, and the same remark applies with even greater force to Christians

among whom immigrants with a proportion of only 687 females per 1,000 males constitute nearly one half of the entire enumerated population.

The discussion of the relative proportion of the sexes among Hindus and Musalmans may next be taken up in detail. The proportion of females to males is lower among Musalmans than among Hindus whether in the actual or in the natural population. In both the religions, females are more deficient in the actual than in the natural population. The gain in the proportion of females in the natural as compared with the actual population is, however, very much greater among Musalmans than among Hindus, amounting to 50 and 8 females per 1,000 males respectively. On comparing the proportion of females in the enumerated population at different age-periods, it will be found that the Musalmans

Age-period	Number of females per 1,000 males	
	Hindus	Musal-mans
0-30 ...	1,009	936
30 and over ...	947	824
Difference ...	62	112

possess, in the early years of life, a slightly lower proportion of females than Hindus and that the difference shows an abrupt increase in the age-period 10-15, this marked disparity continuing practically undiminished throughout the later years of life. Considering only the two age-periods 0-30 and 30 and over, the marginal figures will show that, as compared with Hindus, Musalmans suffer from a much greater decline in the proportion of females in the later period.

128. The proportion of the sexes among the main castes, tribes and races **Castes.** is shown in Subsidiary Table IV. It will be seen from the figures in column 2 of this table that it is only among Bestas that females exceed males. It is significant that more than two-thirds of the population of this caste is to be found in the Mysore District where the general proportion of females is so high as 1,019 per 1,000 males. If the several castes are arranged in order according to the proportion of females, the first six places are taken by Besta, Vakkaliga, Lingayat, Kuruba, Ganiga and Agasa, while the last six are held by Sheikh, Vaisya, Mah-ratta, Indian Christian, Pathan and Saiyid.

Caste	Number of females per 1,000 males in		Number of persons in Mysore District per 1,000 in the whole State
	Mysore District, including Mysore City	Mysore State, as a whole	
Besta ...	1,024	1,005	677
Brahman ...	1,016	973	222

So far as the statistics go, they do not seem to suggest any interdependence between the proportion of the sexes and the relative social status of different castes. On the other hand, a comparison of the marginal figures relating to Bestas and Brahmans in the Mysore District as well as in the whole State would point to locality rather than

caste or race as the main factor to be reckoned with. In fact, the same view receives additional support from the marginal tabular statement which shows

* Including Mysore City.

that almost all the numerically important castes generally possess a higher proportion of females in Mysore and Hassan Districts than in other parts of the State:—

It is remarkable that nearly all the castes mentioned in Subsidiary Table IV exhibit a higher proportion of females to males in the age-period 15-20 than in the earlier period 12-15. This must be mainly attributed to inaccuracies in the age return, as unmarried females aged 12-15 are often returned as younger than they really are. A similar tendency of exaggerating the age in the case of married females between 12-15 may be reflected in the abnormally high proportion of females in the age-period 15-20 among Brahmans and Vaisyas.

Age-pe-
riods.

129. On examining the figures in column 4 of Subsidiary Table II, it will be seen that, during the first five years of life, females exceed males in number and that this numerical superiority is kept up, though in a somewhat lower proportion, in the next quinquennial age-period 5-10. There is a sudden drop in the proportion of females in the next two periods 10-15 and 15-20, which is to be mainly attributed to greater mortality among females at the time of puberty and first delivery. There may have been also inaccuracies in the age return of females belonging to the period 10-15 owing to the tendency of understating age in the case of unmarried girls, thus unduly lowering the visible proportion of females at this period. But such defects in the age return must have been considerably eliminated in the present Census enumeration, as evidenced by the

Age	Number of females to 1,000 males	
	1901	1911
5-10 ...	1,004	1,043
10-15 ...	868	951

relatively easy fall in the proportion of females in passing from the age-period 5-10 to the next higher period 10-15, as compared with the previous Censuses (*vide* marginal figures). From 20 to 30 years of age, females seem to have a firmer hold on life than males owing probably to the impulsive and reckless nature of the latter at this period of life,

although the *jerky* preponderance of females in the age-period 20-25 is to be really ascribed to the defective nature of the age return (*vide* para 108 of Chapter V). From 30 onwards up to 50, males fare better than females, while above 50, the latter, having passed the stage of child-bearing, gain once more an advantage over the former, although the rise in the proportion of females may also be partly due to inaccuracies in the age return resulting from the tendency of exaggerating age in the case of old women.

Census
figures
and vital
statistics.

130. In correlating the Census proportion of the sexes at different age-periods with the results of vital statistics, the first subject for consideration concerns the proportion of the sexes at birth. The numerical superiority of females over males at each of the first five years of life, kept up at a steadily high ratio of more than 1,050 females per 1,000 males according to Census figures, naturally leads to the presumption that more females are born than males. But as the reported vital statistics for the decade 1901-10 point only to 966 female births for every 1,000 male births and as males are also said to exceed females at birth generally in all parts of India and in Europe as well, the figures must be carefully examined before coming to a definite conclusion on the point. It is generally held that although vital statistics suffer from defects of omission in the registration of births and deaths, it cannot be said that such omissions occur more largely with regard to female births and deaths than similar occurrences relating to males. Granting this, let us see what follows. From Subsidiary Table V, it will be seen that 966 females were born for every 1,000 males during the decade 1901-10. The death-rate in the first year of life is shown in Subsidiary Table IX of Chapter V as 80.2 per mille among males and 68.6 among females. But owing to omissions in the registration of deaths, the real death-rate among infants must be taken at a very much higher figure. Let us pitch

it so high as 200 per mille for male infants. Then, out of 1,000 male births, there will be 800 surviving at the end of the first year of life. Corresponding to 200 deaths among male infants, there can be only 173 female deaths according to the proportion shown in column 14 of Subsidiary Table VI, so that out of 966 female births the survivors at the end of the first year will number only 793. Thus the proportion of males to females at the end of the first year will be as 800 to 793, whereas the Census proportion of male and female infants under one year is as 1,000 to 1,051. In fact it is difficult to arrive at the latter proportion on any basis other than an excess of females over males at birth, unless we adopt the apparently inconsistent course of accepting the proportion of the sexes at birth according to vital statistics and at the same time questioning the accuracy of the proportion regarding infantile mortality worked out from the same statistics. At any rate, there is reason to suspect that, in the registration of births and deaths, omissions occur more largely with regard to females than males.

Viewed in the light of the conclusions arrived at from the Census proportion of females to males at different age-periods, the figures indicating the proportion of female to male deaths in column 14 of Subsidiary Table VI suggest that the same tendencies of over- and under-stating age in certain circumstances which vitiate the accuracy of the Census age return must have also operated in the registration of vital statistics so as to unduly reduce the proportion of female to male deaths in the age-period 10-15 and exaggerate similar proportions in regard to the age-periods 20-30 and 60 and over.

131. The proportion of females to males, whether in the actual or natural population of the State, shows a slight decline as compared with the previous Census of 1901; or in other words, there has been a more rapid increase in the male than in the female population during the past decade. As between the two Natural Divisions in the State, it is only in the Eastern Division that a similar result is seen, whereas in the Western Division the proportion of females has actually increased since 1901. It is not profitable to attempt to correlate the above features with the results of vital statistics, for, neither the excess of male over female births nor the excess of deaths over births during the past decade, as indicated by recorded vital statistics, is borne out by the Census figures, as explained in the previous para and in paras 40 and 41 of Chapter II respectively. In fact according to vital statistics the excess of deaths over births during the past decade numbers 85,127 among males and 59,392 among females so that the proportion of females to males should have really increased during the decade, whereas the Census figures indicate just the reverse.

Let us next examine the variation in the proportion of the sexes from the earliest Census of 1871 onwards. In that year there were 994 females for every 1,000 males in the enumerated population. This proportion went up to 1,007 in 1881 owing chiefly to greater mortality among males during the severe famine of 1876-7. From 1881 to 1891 the figure went down to 991, all the districts showing a uniform decline from the more or less abnormal proportion of the sexes reached in 1881. Taking the figures for the State as a whole, there has been a further steady decline in the proportion of females from 1891 onwards. Viewed, however, by divisions and districts, there have been a few exceptions to this general downward trend. In the Western Division, as well as in two of its component districts, *viz.*, Kadur and Shimoga, the female element has steadily increased since 1891 while in the remaining district of Hassan also the proportion of females has risen since 1901. Again, in two of the districts of the Eastern Division, *viz.*, Kolar and Chitaldrug, the proportion of females has practically remained stationary since 1901 while there has been a steady increase in the City of Kolar Gold Fields from 1891 onwards.

The above fluctuations in the proportion of the sexes in the population of the State have to be accounted for by variations in the proportions of the sexes as regards births, deaths and migration. But it is not easy to apportion the relative operative influences of these three factors in each particular case.

132. The question has often been raised as to why males should generally preponderate over females in the population of India whereas the case is just the reverse in the greater part of Europe. It is suggested by a few European *statisticians* that the difference is to be partly explained by the omission of females in

Comparison with previous Censuses.

Contrast with European countries.

the Census enumeration in India. This view seems to be untenable, at any rate as regards Mysore where people have not manifested any tendency of fighting shy of the Census and there is no reason to believe that there have been any such omissions in enumeration. On the other hand, a comparative study of the figures showing the proportion of the sexes at different age-periods in India as well as in European countries where females are in excess of males, points to relatively greater mortality among females in India as an adequate explanation for the deficiency of females which is peculiar to this country. Various causes are said to contribute towards this result and they will be examined in the following serial order, with special reference to conditions in Mysore:—

(i) *Female infanticide*.—This does not seem to have prevailed in Mysore at any time in the near past, and is at any rate unheard of at the present day.

(ii) *Neglect of female life*.—In Hindu households, a son is looked upon as a necessity not only for the support of his parents in old age, but also for saving their souls after death by the performance of religious ceremonies. A daughter, on the other hand, is after all a temporary member of the household of her parents and after marriage she joins a different family. It is no surprise therefore to find that sons are generally preferred to daughters. Added to this, the difficulty, and expenditure of money involved in marrying a girl to a suitable husband lead to a comparative neglect of female children on the part of parents; or to put it in a milder form, girls are not as carefully and anxiously tended as boys.

(iii) *Infant marriage and premature child-bearing*.—The prevalent system of early marriage and consummation within a short interval after the married girl attains puberty is responsible for the early breakdown of the girl's constitution owing to the severe strain of maternity imposed on her while still very young.

(iv) *A very high birth-rate*.—Although the average fecundity of women in India is lower than in Europe (*vide* para 118 of Chapter V), the *crude* birth-rate is considerably higher in India owing to the universality of marriage. Taking the sum total of the female population, the aggregate number of births being a proper measure of the strain they are put to, the higher birth-rate in India will conduce towards a relatively higher female mortality in this country as compared with Europe; or in other words, the number of unmarried females being proportionately greater in Europe, more women escape the ordeals of childbirth and are therefore exposed to less risks in life than in India.

(v) (a) *Unskilful midwifery*, (b) *Confinement and bad feeding of women at puberty and during their menstrual period and after childbirth*, (c) *the hard life of widows* and (d) *the hard labour which women of the lower classes have to perform*, these are all mentioned as peculiar conditions of Indian life, conducive to greater mortality among Indian women as compared with their sisters in Europe. All these conditions obtain also in Mysore and there can be no doubt that female life is to some extent prejudicially affected thereby.

133. Turning once more to the subject of variation in the proportion of the sexes within the State itself, the excess of females over males which is a peculiar feature of Mysore and Hassan Districts deserves more than a passing mention. The proportion of females has been highest in these two districts from the earliest Census. We have also seen (*vide* para 128) that all the main castes

	Number of females per 1,000 males in the		
	White State	Mysore District	Hassan District

1971	991	990	991
1981	991	990	991
1991	991	990	991

have generally a higher proportion of females in these districts than in other parts of the State. The question then arises as to how this peculiar local phenomenon is to be accounted for. Neither recorded vital statistics nor the Census figures point to any strikingly higher proportion of females to males at birth in these districts as compared with other districts in the State. On the other hand, a comparative study of the proportion of the sexes at different age-periods (*vide* margin) leads to the inference that the death-rate among females aged 20 and above must be

comparatively low in these two districts. It is not easy to say how this result is brought about; nor is it possible to lay stress on any peculiarities of soil, elevation, climate, etc., which obtain in these tracts, but not in any of the remaining six districts. Perhaps in Mysore and Hassan Districts the standard of comfort among females may be somewhat higher and they probably enjoy more of out-door life; and this may partially account for the lower death-rate among women of these districts than in other parts of the State.

134. Although it will be very interesting and useful to know the causes that determine the sex of the offspring, biology has yet to furnish a satisfactory solution of the problem. Various theories have, however, been advanced by European writers on the subject and a few of these theories that have gained widespread currency refer either to the relative age of the parents or to their relative superiority or to the state of nourishment of the organisms at the time of conception as affecting the sex of the child. According to this last-mentioned theory, organisms in a high state of nourishment tend to produce more female offspring than male and in the opposite case more male. This theory is perhaps the most widely accepted one at present and it also claims some degree of accord with the findings of biology as it points to the female as the outcome and expression of relatively preponderant *anabolism* and the male of relatively preponderant *katabolism*. It seems also to receive further support from the results of vital statistics; for an examination of the monthly variations in the proportion of the sexes at birth in Mysore during the last five years reveals a relatively larger proportion of female births during the latter half of the year (*i.e.*, July to December) as compared with the first six months (January to June); and the period of conception corresponding to births occurring from July to December ranges from October to March which is the season of plentiful harvests for the agricultural population.

Theories regarding causation of sex.

The prevalent Indian theory as regards the causation of sex emphasises the importance of the period (*i.e.*, number of days) that elapses between menstruation and conception. If conception takes place on *odd* days reckoned from the commencement of menstruation, a female child will be born and if on *even* days, a male child. As presupposing an excess of blood in the female organism on *even* days reckoned from the appearance of menses, and a relative diminution of blood on *odd* days, the above theory is akin to the other one already referred to, which attributes the determination of sex to the state of nourishment of the organism at the time of conception.

135. We may now conclude this chapter with a brief reference to ceremonies which are performed with a view to make a married woman conceive or to secure a male offspring. The object of the ceremony called "*Garbhādāna*" is to bring about conception and it is performed at the time of consummation. Another ceremony known as "*Pumsavana*" is intended to secure the birth of a male child, and although, according to Shastras, it should be performed in the third or fourth month of pregnancy, it is rarely so done and is often combined with "*Sīmanthōnayanāna*" which is a purificatory ceremony done in the sixth or eighth month of pregnancy.

Ceremonies for begetting children.

Besides the above observances which are obligatory and confined only to the "*twice-born*" classes, there are a few others which are occasionally resorted to among the Hindus generally with a view to begetting children, and they are as follows:—

- (i) "*Asvatthapradakshina*" which consists in the woman worshipping the *Asvattha ficus religiosa* tree and walking daily round it 108 times for a period of 48 days.
- (ii) "*Asvattha Vivāha*" which is a symbolical marriage of an *Asvattha* plant with a *Margosa* plant, in which both the husband and wife take part.
- (iii) "*Nāgaprathishta*" or worship of the "*Cobra*" deity in the form of an image carved in stone.
- (iv) "*Nāgabali*" or performing the obsequies of a dead cobra with all the formalities observed in ordinary funeral ceremonies.

CHAPTER VII.

CIVIL CONDITION.

136. The heading of this chapter is meant to refer to the state of an individual from the point of view of marriage, *i.e.*, whether the person is unmarried, married or widowed. Statistics regarding civil condition by age and sex are contained for each religion in Imperial Table VII, and for each caste, tribe or race in Imperial Table XIV. The salient features of these statistics are brought out in the following Subsidiary Tables appended to this chapter:—

Reference
to statis-
tics.

- (i) Distribution by civil condition of 1,000 of each sex, religion and main age-period at each of the last four Censuses.
- (ii) Distribution by civil condition of 1,000 of each sex at certain ages in each religion and Natural Division.
- (iii) Distribution by main age-periods and civil condition of 10,000 of each sex and religion.
- (iv) Proportion of the sexes by civil condition at certain ages for religions and Natural Divisions.
- (v) Distribution by civil condition of 1,000 of each sex at certain ages for selected castes.

137. It is a trite observation, but none the less true, that the married state is much more common in India than in Europe. Among Hindus who constitute the bulk of the Indian population, marriage is considered as a religious duty and it is performed at a very early age and as a rule before the girl attains puberty. Accordingly we find that among every 1,000 males in India, only 492 were unmarried according to the Census of 1901 as against 608 in England in the same year, while in the case of females the disparity is even more striking, the corresponding figures for India and England being 344 and 586 respectively.

Contrast
with
Europe.

138. In Mysore, according to the recent Census, out of every 11 males, 6 are unmarried; and of the latter more than two-thirds are less than 15 years of age. Among those aged from 15 to 40, only 9 out of every 20 are bachelors, while among those aged 40 and over it is only 1 in 30. The proportion of the unmarried is much lower still in the case of females. Among them 4 out of every 11 are unmarried; and more than five-eighths of the total number of spinsters are less than 10 years old and ten-elevenths under 15. Among females aged from 15 to 40, only 1 in every 14 is unmarried while among older women it is even less than 1 in 70.

General
review..

There are practically no married males less than 15 years old. At '15-20,' 1 in every 12 males has a wife; and the proportion rises steadily to 2 in 5 at '20-25,' to 7 in 10 at '25-30,' 17 in 20 at '30-35' and 18 in 20 at '35-40,' after which there is a gradual decline corresponding to a complementary increase in the proportion of widowers. Females enter on matrimony much earlier in life; and between the ages of 5 and 10, 8 per mille are already married. At '10-15' more than 1 in 5 is wedded, and the proportion goes up to 3 in 4 at '15-20' and culminates at '20-25' with more than 17 married out of every 20. Beyond the age of 25, the proportion of married females suffers a steady decline owing to mortality among husbands and increase in the ranks of widows. It is interesting to note that the highest proportion of the married among males is claimed by the age-period 35-40, while it is '20-25' for females.

139. The above remarks apply to the entire population of the State. Let us next consider the salient features of the statistics of marriage relating to each of the religions in turn. First, as regards Hindus, they constitute 92 per cent of the total population, so that the proportional figures indicative of their distribution by age, sex and civil condition do not show any appreciable variation from those relating to the entire population of all religions taken together. A close comparison of the two sets of figures reveals, however, a slight excess in the proportion of the married at '15-20' in the case of Hindu males, and at '10-15'

Vari-
ations by
religion.
(i) Hindus.

and '15-20' in the case of Hindn females. This must be due to the prevalence of early marriage among this community.

(ii) Musalmans.

140. As compared with Hindns, there are, in every 200 Musalman males, 5 more unmarried, 2 less married and 3 less widowed. The higher proportion of bachelors is due to Musalmans marrying at a comparatively later age than Hindns. On the other hand, the decrease in the proportion of Musalman widowers may be attributed to the existence of greater facilities for their remarriage owing to the availability of widows for such marriage and to the absence of any costly and elaborate religious formalities that are characteristic of a Hindn wedding. Among Musalman females, although the proportion of wives of all ages is the same as among Hindns, it is only half of that among the latter between the ages 5 and 10 and two-thirds of the same at '10-15.' This deficiency is made up at later age-periods where the ranks of the married must have been augmented by the remarriage of Musalman widows. This accounts also for the lower proportion of widows as compared with Hindns.

(iii) Animists.

141. Among Animists, the proportion of married males is the same as among Musalmans, although from age 10 to 20 marriage appears to be more frequent among Animist boys. The proportion of widowers is higher than among Musalmans but lower than among Hindns. As regards females, the Animists have proportionately the largest number of married women and the smallest number of widows. With them, marriage in the earlier ages prior to 20 seems to be less common than among Hindus, Musalmans or Jains.

(iv) Jains.

142. The Jains possess a smaller proportion of the married of either sex than Hindns, Musalmans or Animists. A detailed examination of the figures for the several age-periods shows that early marriage is most prevalent among them. They also hold the unenviable position of possessing the highest proportion of widowers and of widows and especially those of the latter under 20 years of age.

(v) Christians.

143. Lastly, the Christian population holds a unique place in certain respects. Among them, the married state is least common in either sex, and early marriage of boys and girls is least in evidence. They possess also a very low proportion of widowers and of widows, the Animists alone showing a still smaller figure as regards widows.

Variations by Natural Divisions.

144. On examining the figures contained in Subsidiary Table II for the two Natural Divisions, it will be found that in the case of both sexes the married condition is more prevalent in the Eastern than in the Western Division, the latter possessing a larger proportion of the unmarried and the widowed. The same local variation is also to be observed in the figures for each of the main religions except in the case of Christians. Christian bachelors are proportionately more numerous in the Eastern Division, and married females in the Western Division. It is a fact that Roman Catholics bulk much more largely in the Christian population of the Western Division than in the Eastern; but in the absence of definite statistics of marriage for the different sects of Christians it is not safe to ascribe the above result to any variation in the relative proportion of such sects in the two divisions. In the case of Christian bachelors, it is curious to note that while the proportion for "all ages" as shown in Subsidiary Table II is considerably higher in the Eastern Division, similar proportions for each of the several age-periods are not favourable to that division. This will perhaps puzzle a lay reader, who may, however, be assured that there has been no mistake in these figures and that they do not rebel against any fundamental axioms* of the mathematical theory of proportions.

145. If the figures for individual districts are examined, it will be found that in the case of both sexes the proportion of the married is lowest and that of the widowed is highest in the Shimoga District, while Kolar District holds the first place as regards the married and the last place as regards the unmarried. It is remarkable that the latter district also contains by far the largest proportion of the Telugu-speaking population of the State and it is generally held that the practice of early marriage is especially in vogue in this linguistic division of the community. This may perhaps partly account for the abovementioned unique position held by this district.

Proportional figures indicating the distribution of the population by civil condition in the several districts and cities are given below:—

District and City	Number per 1,000 males			Number per 1,000 females		
	Unmar-ried	Married	Widow-ed	Unmar-ried	Married	Widow-ed

146. The subject of infant marriage cannot be dealt with in this report as fully as its importance demands. The evil effects of this system are admittedly grave and still it prevails in India while the Western nations have none of it. There have been various conjectures as to the cause of its peculiar origin and persistence in India. Some of the Hindu social reformers hold that, in the earliest period of Aryan occupation of India, 'adult' marriage was the rule as evidenced by the spirit of the Vedic 'mantras' of the marriage ritual and that in later times of turbulence and wars and foreign Musalman invasions, the practice of pre-puberty marriage of girls was enjoined as a practical measure of safeguarding the chastity of Hindu girls from violation at the hands of the foreigners that dominated the country. They argue further that, in modern times of peace and enlightened Government, the practice should be thoroughly condemned and put a stop to, whatever doubtful justification it might have had in the past. Finally they deny that there can be any religious sanction for early marriages.

147. Turning to the actual state of things in Mysore, as far as can be judged from the Census figures of Imperial Table VII, we find that, in a total population of nearly six millions, the number of married children under five years is 26—9 male and 17 female—besides a single child-widow of the same tender age. Among boys between the ages of 5 and 10 numbering in all nearly 370,000 in the State,

Sex and Age	Number per mille unmarried in			
	Mysore	Madras	Bombay	Baroda
Male— 0-5...	1,000	998	992	959
5-10...	1,000	991	955	883
Female—0-5...	1,000	994	965	915
5-10...	992	946	835	807

90 have wives and 2 are widowers, while among girls of the same ages, one in every 128 is married, and the actual number of widows is 55 which comes to about 1 in 7,000. The marginally noted figures indicate that infant marriage in Mysore is much less common than in either of the adjacent British Provinces or in a Native State like Baroda.

148. In judging of the varying degrees of prevalence of infant marriage among the adherents of different religions as far as Census figures permit, we may as well confine ourselves to a discussion of the civil condition of girls between the ages of 5 and 10; for, as we have already seen, married boys of less than

ductory.

(ii) Gene-
ral review.

(iii) By
religion.

10 years as well as child-wives under 5 are too few in numbers to form an adequate basis of comparative study in statistics. Even as regards girls aged from 5 to 10, the total number as well as the number of married ones among Christians, Jains and Animists is so small when compared with the same among Hindus and Musalmans that any inferences based on a comparison of mere proportional figures must be received with some caution. The proportion of unmarried girls aged from 5 to 10 is highest among Christians and lowest among Jains, while Musalmans, Animists and Hindus come between the above two in the order named (*vide* marginal figures). The figures for the next higher age-period

Religion	Number of unmarried girls per mille aged	
	5-10	10-15
Hindu	992	771
Musalman	996	858
Christian	999	933
Jain	991	682
Animistic	995	859

'10-15' are also interesting, as reflecting, however roughly, the varying tendencies of early marriage among the different communities. Arranged according to the magnitude of the proportion of unmarried girls aged from 10 to 15, the different religions stand as follows:—Christian, Animistic, Musalman, Hindu and Jain, *i. e.*, in the same order as was observed in the case of the earlier age-period '5-10' except for an interchange of places between the Animists and Musalmans. The conclusion then seems to be that

early marriage is most common among Jains and least so among Christians, while Animists and Musalmans marry somewhat later in life than Hindus.

(iv) By
Natural
Divisions.

149. The proportion of unmarried girls in each of the age-periods 5-10 and 10-15 is higher in the Western than in the Eastern Division. Viewed by religions also, the same local difference is observed in the case of Hindus, Musalmans and Animists, but among Christians and Jains, girl-wives of the above ages are more common in the Western Division. It is not easy to say how far the greater prevalence of early marriage in the Eastern Division may be due to the earlier age at which girls may attain puberty in the warmer climate of these parts as compared with the hilly tracts of the Western Division.

(v) By
districts.

150. Descending to figures for districts and cities, it will be seen from the following tabular statement that the proportion of unmarried girls, whether in the age-period 5-10 or 10-15 is highest in the Hassan District with Kadur coming next after it.

District or City	Number of unmarried girls per mille aged	
	5-10	10-15
Bangalore City	993	710
Bangalore District	991	731
Kolar Gold Fields (City)	990	817
Kolar District	991	742

Shimoga District	990	747
Civil and Military Station, Bangalore	995	841

(vi) Com-
pared
with past
Censuses.

151. On comparing the figures indicating the proportion of unmarried children of less than 10 years of age for the past three Censuses (<i>vide</i> margin), it will be found that there has been a steady improvement since 1891 in the discontinuance of infant marriage. Although this satisfactory result reflects a corresponding gradual growth of enlightened ideas among the people during the past two decades, it cannot be denied that the Mysore Infant Marriage Prevention Regulation has been		Number unmarried per 10,000 aged 0-10	
Year		Male	Female
1891	...	9,989	9,740
1901	...	9,995	9,904
1911	...	9,999	9,959

largely responsible for educating the masses in this respect and bringing about the present improved state of things. A brief summary of the results of the working of this Regulation cannot therefore fail to be of interest in this connection.

152. The Mysore Infant Marriage Prevention Regulation was passed in (vii) Mysore Infant Marriage Prevention Regulation. October 1894 and came into force 6 months later. It applies only to marriages among Hindus. It prohibits not only the marriage of girls under 8 years of age but also the marriage of men who have completed their 50th year of life with girls who have not completed the 14th year. During the past 16 years, *i.e.*, from 1895-96 to 1910-11, the total number of cases prosecuted under the Regulation was 202, of which 175 resulted in the conviction of 475 persons. This works out to an average of 11 cases with 30 persons convicted per year. Such cases were relatively more numerous during the first three years from the commencement of the Regulation and also later on from 1901-02 to 1905-06; but, of late, during the past five years there have been only five or six cases with about 15 persons convicted on an average per year.

153. It may be interesting to note that a similar piece of legislation was enacted in Baroda in 1904, *i.e.*, 10 years after the passing of the corresponding Regulation in Mysore. The age limit of girls was, however, fixed at 12 in Baroda as against 8 in Mysore. But as there was a clause in the Baroda Act authorising the marriage of girls under 12 but over 9 years after obtaining exemptions which were to be granted under certain circumstances, and as such permission is reported to have been accorded in 95 per cent of the cases wherein the same was applied for, we may practically consider 9 as the effective age limit prescribed by legislation. Even then it is a little higher than what is laid down in the Mysore Regulation. We are, however, told that, during a period of 7 years from 1904 to 1910, so many as 23,388 persons were convicted under the Baroda Act while the corresponding figure for Mysore is relatively insignificant. This appears to show that the present piece of legislation in Baroda is much more advanced than in Mysore, and much farther ahead of current notions and practices among the people at large. It has already been pointed out that, as regards early marriage, the recent Census figures are more favourable to Mysore than to Baroda. (viii) Legislation in Baroda.

154. Let us next consider the statistics of widows. It is notorious that the proportion of widows in India is abnormally large when compared with that obtaining in European countries. The peculiar social conditions of India that are responsible for this result are to be found in the universality of marriage, the prevalence of early marriage and the prohibition of widow marriage. We may confine our present discussion, for the sake of simplicity, to figures relating to widows in the reproductive period of life, *i.e.*, from 15 to 40 years of age; for, not only will these figures faithfully reflect the influence of the above three social factors but they will also be significant as regards economic waste in the community from the standpoint of increase of population. Prevalence of widowhood. (i) Introductory.

155. In Mysore, out of every 1,000 females aged from 15 to 40 years, 130 have been returned as widows. Viewed by religions, the proportion of widows at this age-period is lowest among Animists, being only 71 per mille. The figure rises to 91 for Christians, 96 for Musalmans and 133 for Hindus, and finally shoots up to 204 for Jains, among whom widowhood is most common. The above differences, so far as they are determined by social causes, must be due not only to the varying prevalence of infant marriage and enforced widowhood in the different communities, but also to variations in the difference between the ages of husband and wife. Judging by the statistics of unmarried girls between 5 and 10 years of age, we have already seen that the main religions stand in the following order with regard to the prevalence of child marriage:—Jain, Hindu, Animistic, Musalman and Christian. As for ascertaining the average difference in the ages of husband and wife, the only practical method of statistics seems to be to calculate the 'mean age' of husbands and of wives in each religion according to the working rule quoted in para 106 of Chapter V and to take the difference as the average excess of the husband's age over the wife's. The figures thus worked out are shown in the margin and they indicate the greatest disparity in the ages of the married couple among Jains and the least among Christians. Finally as regards enforced widowhood, the recent Census does not afford any materials to determine, even roughly, the relative prevalence of widow marriage in different communities. (ii) By religion.

Religion	Mean age of married		Difference
	Males	Females	
Hindu ..	40·4	29·7	10·7
Musalman ...	40·8	29·9	10·9
Christian ...	39·4	30·4	9·0
Jain ...	39·3	28·0	11·3
Animistic ...	41·1	30·8	10·3

of husband and wife, the only practical method of statistics seems to be to calculate the 'mean age' of husbands and of wives in each religion according to the working rule quoted in para 106 of Chapter V and to take the difference as the average excess of the husband's age over the wife's. The figures thus worked out are shown in the margin and they indicate the greatest disparity in the ages of the married couple among Jains and the least among Christians. Finally as regards enforced widowhood, the recent Census does not afford any materials to determine, even roughly, the relative prevalence of widow marriage in different communities.

It is, however, a matter of common knowledge that such marriages are prohibited among Jains and the 'higher' castes of Hindus. Although the latter constitute but a small portion of the total Hindū population, their example in this respect has also spread among the 'lower' castes, prohibition of widow marriage being commonly viewed by them as a badge of respectability in the social scale. Among Musalmans, Animists and Christians, there is no such prohibition, and the prevalence of polygamy among the first two would naturally result in widow marriage being more frequent than among Christians who are strict monogamists. As between Musalmans and Animists, the ease and facility with which marriages are performed as well as economy of expenditure seem to be on the side of the latter, so that in all likelihood their widows re-enter the portals of matrimony much more freely than their Musalman sisters in similar plight. We may accordingly arrange the different religions as regards the varying degrees of prevalence of widow marriage in the following order:—Animistic, Musalman, Christian, Hindū and Jain. Actual statistics of widow marriage compiled in the Census of 1901 pointed also to the same relative position of these religions in this respect.

(iii) By Natural Divisions. 156. A comparison of figures for the two Natural Divisions shows that widows of child-bearing age are more common in the Western Division although infant marriage is more freely resorted to in the other division. The high proportion of widows in the '*malnad*' tracts must be due to the relatively shorter span of life generally enjoyed by people in those parts.

(iv) Compared with past Censuses. 157. It is satisfactory to note that the proportion of widows of child-bearing age has been steadily declining ever since 1881. In that year, it was so high as 234 per mille owing to the great havoc caused by the disastrous famine of 1876-77. It fell to 152 per mille in 1891 to 139 in 1901 and finally to 130 in 1911. A similar gratifying improvement is also observable in the steady decline of girl-widows (of less than 15 years of age) from 1881 onwards.

Polygamy.

from the tabular statement printed on page 231 of the Mysore Census Report of 1901, while the following extract is also from the same report :—

* * *

there is no denying that polygamy exists in India. It is allowed in all classes except the Christians, but under restrictions which render it rare. Among the higher castes of the Hindus, a second wife is permitted, not as a luxury, at the mere caprice of the husband, but only when the existing wife, proves barren or is afflicted with some loathsome incurable disease or is guilty of immoral conduct. * * *

How much polygamy is discouraged though sanctioned among the Brahmans may be judged from the fact that the first wife alone, except when cast off for immoral conduct, is entitled to join the husband in religious ceremonies and that the second or subsequent wife has no status here unless with the acquiescence and consent of the first wife."

159. Polyandry is unknown in Mysore.

Polyandry

160. Let us next examine the statistics of civil condition with regard to different castes. The figures are given in Subsidiary Table V for 28 selected castes. The proportion of married girls between the ages of 5 and 12 is so high as 95 per mille among Brahmans who are closely followed by Vaisyas with 85 per mille. In both these castes girls are, as a rule, married before attaining maturity. The Mahrattas, Kumbharas, Nayindas and Ganigas have also a considerable proportion of young married girls, although they come a long way behind the Brahmans and Vaisyas. Early marriage seems to be least common among the Indian Christians who have only 6 married girls out of every 1,000 in the age-period 5-12.

Marriage by caste.

If the proportion of widows between the ages of 20 and 40 be considered, the Brahmans again top the list with the Vaisyas closely competing with them for the first place. The prohibition of widow marriage is mainly responsible for the large proportion of widows in both these castes. On the other hand, widows are not half so numerous among the Madigas, Voddas and Lambanis owing to the fact that widow marriage is very freely practised in these castes.

161. Before concluding this chapter, a brief reference may be made to some of the interesting marriage customs in vogue among the different castes in this part of the country.

Marriage customs.

(a) The woman who remains unmarried in life is usually viewed askance in Hindu society. She cannot take any prominent part in domestic or social functions. At her death, funeral ceremonies are not gone through with the usual formality among a few castes, *e.g.*, Agasa and Meda, while the Beda caste does not in such a case perform any obsequies at all, the dead body being simply carried without the usual bier and interred with the face downwards.

Unmarried women.

(b) The practice of dedicating girls to temples or as public women (styled as *Basari*) obtains in a few of the 'lower' castes, but it is gradually getting into disfavour. Among Kumbharas when there are no sons in a family, the eldest girl is occasionally so dedicated. In the Beda caste, the ceremony of dedication as 'Basari' resembles that of a regular marriage. The girl is taken in procession to a temple and is there seated by the side of a dagger, the 'tali' being tied to her by the 'purohit' or by a maternal uncle's son. Her children are considered legitimate. Among Voddas, if an adult female cannot get any one to marry her, she may be dedicated to a free life in the name of Yellamma who is their patron deity.

Public women.

(c) Although the bride must, as a rule, be younger than the bridegroom, exceptions are allowed in Tigala, Kadugolla and Koracha castes. In the last caste, there is a special obligation for a man marrying his sister's daughter, even though older than himself. Among Holeyas and Mondarus, the bride may be older if she is already a widow.

Relative ages of bride and bridegroom.

(d) It is only among Brahmans and rarely in a few other castes that the practice of paying for the bridegroom prevails in varying degrees. Of late, the price of the bridegroom has gone up considerably, the amount varying with the property or the University qualifications of the boy. Barring this practice which is of comparatively recent growth and which exists only among a small fraction of the total

Bride-price.

population, the general rule is for the bride to be paid for. The bride-price varies from a nominal amount of a rupee or two as among Tigalas to 50 or even 100 rupees as in the Dombar or Koracha castes. The practice is, however, modified under rare circumstances, *e.g.*, among Idigas if two families exchange brides, when the bride-price is paid by neither, or in the Meda caste if a girl is married to her maternal uncle, when the amount is either reduced or excused altogether. Again, as a general rule, a widow is paid only half the amount that would go to a virgin bride. So also a widower has to pay more than a bachelor except in a few castes like Koracha and Nayinda.

- Polygamy.** (e) Among Bestas, the first wife's sister is generally preferred as a second wife.
- Endogamy.** (f) Endogamous groups of the 'functional' or 'occupational' type are found in a few castes like Sannyasi and Besta. Among Bestas, there will be no intermarriage between families engaged in different occupations, *viz.*, agriculture, fishing and palanquin-bearing.
- Hyper-gamy.** (g) Instances of hypergamous divisions are very rare in Mysore. In the Madiga caste, the 'Jambavas' who form the priestly division of the caste do not allow their women to be married into other divisions.
- Exogamy and prohibited degrees.** (h) Exogamous divisions occur in most of the Hindu castes. The 'gotra' of Brahmans belongs to the *eponymous* type of such divisions. The *totemistic* type is met with among several castes, *e.g.*, Madiga, Banajiga, Kumbara, etc.
- A man is generally prohibited from marrying his mother's sister's daughter or his younger sister's daughter. Among Korachas, however, a widower is allowed to marry his younger sister's daughter. In Koracha, Komati and Nayinda castes, one cannot marry in the section to which one's maternal grandmother belongs. Among Komatis, the 'gotras' of the maternal uncles of the bride and of the bridegroom should not be the same.
- Cousin marriage.** (i) In the Komati (Vaisya) caste, there is a moral obligation for a boy being married to his maternal uncle's daughter.
- Marriage by capture.** (j) Among Lambanis, the women weep on marriage occasions, which is perhaps a relic of 'marriage by capture.'
- Interval between marriage and consummation.** (k) In the case of marriage of a young girl, she continues to stay with her parents till she attains puberty. Afterwards, she is formally taken to the husband's house where they live together. In case the girl has already attained womanhood at the time of marriage, consummation also takes place generally at the same time. In the Agasa caste there must, however, be an interval of 15 days between marriage and consummation, while the Kurubas go further and insist on an interval of three months as they consider it inauspicious that a child should be born within a year of the marriage.
- Marriage of widows.** (l) The marriage of widows is prohibited only among Brahmans and in a very few other castes. Among the rest, such marriages are allowed. In a few castes like Besta and Uppara, a fine has to be paid for the benefit of the caste people if a man marries a widow. A widow is not generally allowed to marry any of her late husband's brothers. But among Bestas, she is permitted to marry her late husband's elder brother on payment of an additional fine. Sometimes the restriction extends to all the agnatic relations of the late husband as in the Uppara caste, and even to all belonging to her father's division as in the Bilimagga and Sannyasi castes. Among Madigas and Idigas, a bachelor cannot marry a widow, while in a few other castes he can do so only after undergoing the formality of a first marriage with an 'ekka' (*calotropis gigantea*) plant.

Terms of relationship. 162. A list of Kanarese terms of relationship with their English equivalents is printed after Sub-idiary Table V of this chapter.

CHAPTER VIII.

EDUCATION.

163. The scope of this chapter is much more limited than what the general reader may naturally expect from the comprehensive nature of its heading. The information recorded on the Census Schedule as regards a person's educational attainments was merely confined to literacy, *i.e.*, ability both to read and write. If a person was literate in one or more languages, the names of these languages were also recorded. The statistics compiled from such entries are contained in Imperial Tables VIII and IX. In the former, the literate population is distributed by age, sex and religion, while the latter exhibits similar details for the several castes, tribes and races. Besides the figures to be found in these two tables which will form the main basis of discussion in the course of this chapter, a passing reference will also be made to such departmental statistics as may throw light on the progress of education in general. The salient features of all the abovementioned statistics have been brought out in the following Subsidiary Tables printed at the end of the chapter:—

Reference to statistics.

- (i) Education by age, sex and religion.
- (ii) Education by age, sex and locality.
- (iii) Education by religion, sex and locality.
- (iv) English education by age, sex and locality.
- (v) Progress of education since 1881.
- (vi) Education by caste.
- (vii) Number of institutions and pupils according to the returns of the Education Department.
- (viii) Main results of University examinations.
- (ix) Number and circulation of newspapers and periodicals.
- (x) Number of books published in each language.

164. Taking the whole population of the State, only 1 in every 16 persons can read and write. Among males, 1 in every 9 is literate, while among females it is only 1 in 77. The proportion of the literate among males less than 10 years of age is 19 per mille; and it increases to 103 per mille at the age-period '10-15', to 137 at '15-20' and finally to 152 at '20 and over.' There is a similar rise in the proportion of literate females from 5 per mille at '0-10' to 20 at '10-15' and to 24 at '15-20', but it drops down to 13 per mille for higher ages. The varying proportions at different age-periods will be discussed later on.

General review.

165. Of the two Natural Divisions, the Western Division is more advanced

Literacy by locality. (i) Natural Divisions.

Diagram showing the number of literate persons per 1,000 of each sex in each Natural Division.

in respect of literacy, containing 62 literate persons in every thousand as against 59 in the other division. On examining the figures for

each sex, however, it is found that the superiority of the Western Division is maintained only in the case of males, and that as regards females it is more backward than the Eastern Division. The relative position of the two divisions is graphically indicated in the above diagram.

166. In discussing the relative prevalence of literacy in the several districts, we may as well exclude the cities for the present and consider the figures for districts as shown in Subsidiary Table II. Of the eight districts, Kadur easily holds the first place with a proportion of 70 literate persons per mille. Then comes Shimoga followed in order by Tumkur, Chitaldrug, Kolar (excluding Kolar

(ii) Districts.

Gold Fields), Hassan and Bangalore (excluding Bangalore City) with proportions varying from 64 to 53 per mille, while, a long way behind, Mysore comes last with not even 4 persons literate in every 100. It is not easy to determine the exact nature of the causes which account for the above variations by district. A brief reference may, however, be made to a few of the more important features affecting the result. Owing to the greater prevalence of literacy among Christians as compared with Hindus or Musalmans, the varying proportions of Christian population in different districts will affect their relative position in the scale of literacy. So also a high or low proportion of immigrants in a district will tend to raise or lower its position as the proportion of literate persons is generally larger among immigrants than in the rest of the population. Again, the nature of the occupations pursued by the people is also a factor to be reckoned with. The capacity to read and write is not in equal demand in occupations of all kinds and agriculture in its present state is comparatively in little need of such a qualification, so that a high percentage of agricultural population in a district tends to lower its position in respect of literacy. Finally, there is

District	Number per 10,000 of Christians	Number per mille of immigrants	Number per mille of persons supported by agriculture	Percentage of villages provided with schools
Bangalore	76	67	762	17.9
Kolar	41	102	729	12.4
Tumkur	22	67	769	22.3
Mysore	12	14	800	21.1
Chitaldrug	4	89	715	27.1
Hassan	64	63	801	20.8
Kadur	131	162	717	23.8
Shimoga	49	101	740	19.1

the spread of primary education to be taken into account. The varying facilities for such education in different districts may be roughly gauged by the proportion of villages equipped with schools in each district. The tabular statement in the margin will elucidate the relative position of the several districts with reference to each of the four aspects mentioned above. It is not possible to go into a minute discussion of all the figures contained in the statement or

to determine the relative influence of each of the four factors referred to therein.

As regards literacy among males, Kadur District once more stands first with

MAP OF MYSORE.

Showing the number of literate males per mille in each district.

1 literate male in every 8 and Mysore District (excluding Mysore City) comes last with only 1 in 14. The varying degrees of literacy in the several districts are indicated in the marginal map with the cities of Bangalore, Kolar Gold Fields and Mysore included in the respective districts. On comparing this map with the one showing the density of population in each district (*vide* page 5), it is clear that, except for Bangalore District, there is no connection between literacy and density, or if at all, it looks as if

the prevalence of literacy generally varies inversely as the density of population. The prevalence of literacy among females is very poor when compared with that among males. Even the highest proportion of literate females in any district does not exceed only to 11 per mille, and this occurs in the Kadur District, while at the other end of the scale Mysore District (excluding Mysore City) exhibits only a proportion of 5 per mille.

167. The inhabitants of cities are, for obvious reasons, far more educated (iii) Cities. than those of rural parts, and we accordingly find that, in the total population of the four cities in the State, 352 males and 101 females per mille can read and write as against 112 males and 13 females in the State as a whole. Of the four cities, Bangalore City contains the highest proportion of literate males, while the lowest is found in Kolar Gold Fields which has none of the advantages of being a seat of learning or of Government or the headquarters of an administrative division. As regards literacy among females, the Civil and Military Station, Bangalore, takes the first place mainly owing to the strength of the Christian element in its population. Considering both sexes together, the relative position of the cities remains the same as for literacy among males, i.e., they stand in the following order:—Bangalore City, Mysore City, Civil and Military Station of Bangalore and Kolar Gold fields.

168. Turning to the statistics of education by religion, we may at the outset dispose of Parsis, Jews, Brahmins, Sikhs and Buddhists with the remark that the numerical strength of none of these communities exceeds 650 in the State and that, as regards spread of literacy among them, they stand in the above-mentioned order with 80 literate persons among 101 Parsis and 172 among 622 Buddhists at either end of the scale. Considering the main religions of the State, literacy among males is most widespread in the Christian population among whom 4 in every 9 can read and write. The Jains come next with 2 literate males in every 5 and the proportion drops down to 1 in 5 for Musalmans and still lower to 1 in 10 for Hindus while the Animists come a long way behind with the lowest proportion of 1 in 91. Literacy by religion.

The disparity in the figures for different religions is still more marked in respect of females. Here again, the Christians take the lead with 7 literate females in every 25; next come Musalmans with 1 in 24, followed by Jains with only 1 in 26, although the latter are really more advanced than the former as regards literacy among males. The proportion of literate females among Hindus is so low as 8 per mille while it is even so negligible as 1 per mille among Animists.

169. The varying degrees of diffusion of education among the several numerically important castes in the State will be manifest from Subsidiary Table VI. It is remarkable that the proportion of literate males among the different Hindu castes ranges so wide as from 707 to 5 per mille, the Brahman and the Madiga being the most advanced and the most backward respectively. Next to the Brahman comes the Vaisya with 581 literate males per mille, followed in order by the Kshattriya, Panchala, Neygi, Lingayat, Banajiga, Mahratta and Ganiga, all of whom exhibit a higher proportion of literate males than the average for Hindus as a whole. Just above the Madiga at the bottom of the list, stand the Vodda and the Holeya with a proportion of only 9 and 17 per mille respectively. As regards female education, the Brahman again takes the lead with 119 literate females per mille. A long way behind comes the Kshattriya with a proportion of only 30 per mille, followed by the Vaisya, Banajiga and Mahratta with 22, 20 and 12 per mille respectively. At the lowest rung of the ladder, the Madiga and the Vodda can boast of very few literate females while the Holeya is only slightly less backward with a proportion of 1 per mille. Literacy by caste.

Among Christians, Europeans and Anglo-Indians are far ahead of Indian

Race	Number literate per 100	
	Males	Females
Europeans ...	91	85
Anglo-Indians ...	65	67
Indian Christians	33	16

Christians (*vide* marginal figures). It is, however, remarkable that the proportion of literate persons among Protestant Indian Christians is nearly as high as among Anglo-Indians, while the Roman Catholic section of Indian Christians lags a long way behind with only 28 males and 9 females literate in every 100 of each sex.

170. Let us next turn to the languages of literacy. Taking up English first, we find that in the total population of the State, 12 males and 2 females in every 1,000 of each sex can read and write this language. Knowledge of English is naturally most prevalent in cities and especially in the Civil and Military Station of Bangalore with its large European and Anglo-Indian population. Among the several districts, Kadur which contains the largest proportion of Literacy by language: (i) English.

Christians is likewise the most advanced in respect of literacy in English, while Mysore District (excluding Mysore City) stands at the bottom of the list. If, on the other hand, the statistics be examined by religion, it will be found that Christians are considerably in advance of Hindus, Musalmans, Jains or Animists. Among Christians, the proportion of English-knowing persons is 284 per mille in the case of males and 194 per mille for females. The proportions are naturally even higher among Europeans and Anglo-Indians as English is generally their mother-tongue, while the figures for Indian Christians are much lower, *viz.*, 123 and 55 per mille as regards males and females respectively. Here again, among the Indian Christians themselves, English-knowing persons are proportionately thrice as numerous among Protestants as among Roman Catholics. The Jains come a very long way behind Christians, with a proportion of only 13 per mille for males and 1 per mille for females, closely followed by Musalmans and Hindus. But in a few of the Hindu castes, *viz.*, Brahman, Kshattriya, Vaisya and Banajiga, the proportion of English-knowing males is comparatively high ranging from 156 to 17 per mille. In fact, the Brahmans claim a higher proportion of males literate in English than even Indian Christians, although Brahman females lag considerably behind their Christian sisters. In the whole female population of Hindus numbering more than 2½ millions, there are only 662 who can read and write English, while 50 can do so in a population of nearly 150,000 Musalman females. The entire Animistic female population of more than 35,000 is absolutely ignorant of English, while, among Animistic males, the number returned as literate in English is actually 4.

We have hitherto been discussing the proportion which the number of persons literate in English bears to the total strength of the population pertaining to a particular religion or caste. It will, however, be interesting to know how far the literate population takes to English in different communities. The marginally noted figures will be suitable for this purpose. It may be pointed out that English is more widely known among the literate Hindus than among literate Musalmans, although the proportion of English-knowing persons in the total population is really higher in the case of Musalmans.

Religion or Caste	Number literate in English per 1,000 literate persons
Hindu	80
(i) Brahman	195
(ii) Kshattriya	115
(iii) Vaisya	37
Musalman	51
Christian	284
Indian Christian	123
Jain	32

(ii) Other languages.

171. Besides statistics of literacy in English, the number of persons literate in each of six other languages, *viz.*, Kanarese, Telugu, Tamil, Hindustani, Marathi and Sanskrit, is shown in Imperial Table VIII and corresponding proportional figures are contained in Subsidiary Table I. In reading these figures, it must be remembered that a person knowing two or more languages is included in the number shown as literate under each of those languages. Among the above mentioned 7 languages including English, Kanarese is cultivated by the largest proportion of the population in the State, *viz.*, 49 per mille. Then comes English, a long way behind, with 7 per mille, followed by Tamil and Hindustani with 5 per mille each, while only 4 per mille can read and write Telugu and 1 per mille can do so in Marathi and Sanskrit. Turning to the statistics by religion, we find that, among Hindus as well as Jains and Animists, Kanarese is the most widespread language of literacy. Its place is taken by Hindustani in the case of Musalmans and by English in the case of Christians. Among the latter, literacy in Tamil and Kanarese is also fairly well diffused, *viz.*, to the extent of 111 and 71 per mille, respectively.

Literacy by age-periods.

172. On examining the proportion of the literate at each of the four age periods '0-10,' '10-15,' '15-20' and '20 and over' (*vide* margin), it will be seen that as regards males, there is a steady increase from 19 per mille at '0-10' to 152 at '20 and over.' In the case of females, the proportion reaches the maximum of 24 per mille at '15-20' and then falls to 13 at '20 and over.' Considering that it is very rare for a person to first learn to read and write after attaining 15 years and that the younger generation aged

Age	Number literate per 1,000	
	Males	Females
0-10	19	13
10-15	117	24
15-20	152	13

from 15 to 20 years must have had at least equal, if not greater, educational facilities than what older persons had formerly enjoyed in their boyhood, it is natural to expect a higher proportion of literate persons at '15-20' than at later ages. The contrary result in the case of males stands therefore in need of some

Religion	Number literate per 1,000 males aged	
	15-20	20 & over
Hindu ...	127	138
Musalman ...	229	291
Christian ...	460	595
Jain ...	522	501
Animistic ...	12	15

explanation. On analysing the figures by religion (*vide margin*), we find the same feature repeated except in the case of Jains. Leaving aside the Animists as too insignificant from the standpoint of literacy, we may point out that the proportion of immigrants among Musalmans and Christians is relatively large and that, not only will literacy be more widespread among immigrants than in the rest of the population, but immigrants will also be proportionately more

numerous at the age-period '20 and over' than at '15-20.' In the case of Christians there is an additional factor operating in the same direction in favour of the age-period '20 and over,' as the Europeans who form the most educated section of Christians are proportionately more numerous at the above age-period than at '15-20.' Similarly also is the case with regard to Brahmins, Kshatriyas and Vaisyas who are the most advanced communities among Hindus in respect of diffusion of literacy. It is doubtful, after all, whether the above circumstances can more than partially explain the case. Let us next try to find out, if possible, how far increased facilities of education are really availed of by the younger generation in increasing numbers. For the sake of simplicity, we may consider the

Year	Primary Schools for boys	
	No. of Schools	No. of pupils
1901-02 ..	1,725	53,875
1902-01 ..	1,709	53,529
1903-01 ..	1,689	50,854
1904-05 ..	1,711	52,589
1905-06 ..	1,701	55,293
1906-07 ..	1,707	53,131
1907-08 ..	1,777	56,631
1908-09 ..	1,801	63,894
1909-10 ..	1,845	61,920
1910-11 ..	1,876	61,976

marginal figures showing, for the past 10 years, the number of boys educated in departmental primary schools. It is curious to observe that the number of pupils in 1906-07 was actually less than in 1901-02, i.e., 5 years earlier. The low figures for 1903-04 and a few other years must be mainly attributable to the ravages of plague, but whatever the cause may be, there is no denying the fact that, judged by these figures, the period of 6 years from 1901-02 to 1906-07 had nothing to record for progress in primary education. This must have also contributed towards

the low proportion of literate males of 15 to 20 years of age at the recent Census. It is remarkable that in a few other Provinces also, e.g., Madras and Burma, there is a similar excess in the proportion of literate males at the age-period '20 and over' as compared with '15-20.'

173. There has been a steady advance since 1891 in the diffusion of literacy in the State. The progress made by females has, however, been more rapid than in the case of males owing to the vast field for improvement among the former and the increasing attention bestowed on female education. On comparing the figures of 1911 with those of 1901 for the several age-periods, a general progress is noticeable all around except in the case of males between the ages of 15 and 20. On a further analysis of the figures by districts, the above decline in the literacy of males at '15-20' is found to occur only in the districts of Bangalore, Kolar and Tumkur. It is not easy to account for the peculiar result in these three districts. It seems, however, somewhat strange that the proportion of literate males at '15-20' in the Tumkur District should have been so high as 221 per mille in 1901.

Compared with previous Censuses.

174. As regards the spread of English education, there has been a steady improvement since 1891 when the proportion of males and of females literate in English stood at 51 and 11 per mille respectively. The figures rose to 83 and 16 in 1901 and have further gone up to 117 and 21 respectively at the present Census. It will thus be seen that females are progressing at a slower rate than males. On examining the figures for the several districts and cities, the same uniform progress is observed everywhere as regards males, but English education among females has practically remained stationary since 1901 in the districts of Tumkur, Chitaldrug, Hassan and Mysore (excluding Mysore City), while there has been

Progress of literacy in English.

an actual decline in the proportion of English-knowing females in Bangalore District (excluding Bangalore City).

Depart-
mental
statist-
ics.

175. We have hitherto confined our discussion to Census statistics of literacy. We may now conclude this chapter with a brief review of the figures compiled from departmental returns and throwing light on the progress of education. The number of educational institutions and of scholars in the State is shown in Subsidiary Table VII for each of the years 1911, 1901 and 1891. The figures indicate a general improvement during the past two decades. The fact that several industrial and a few commercial schools have sprung up during the last decade is

Year	Amount spent on primary education from Provincial and Local Funds	Expenditure per 1,000	
		Of total population	Pupils (Primary) in Public Institutions
	Rs.	Rs.	Rs.
1900-01 ...	2,41,622	45	3,735
1910-11 ...	3,18,441	56	4,257

a distinct and gratifying sign of appreciation of the importance of industry and trade. The expenditure incurred from Provincial and Local Funds on primary education in the State (excluding the Civil and Military Station, Bangalore) in 1910-11 as well as 1900-01 is shown in the margin. It will be seen that the amount spent in 1910-11 shows an

increase of about 30 per cent over the corresponding figure for 1900-01.

Let us next see whether there is any correspondence between the number of literate persons between the ages of 15 and 20 according to Imperial Table VIII and the number of scholars in educational institutions in 1911. Excluding pupils of primary and elementary schools as too young for the age-period under consideration, we have 34,031 scholars as against 43,359 literate persons. The difference between these two figures is mainly attributable to the fact that many of the latter would have already discontinued their scholastic studies, more especially among females. It may also be noted that occasionally girls are taught the three R's at home without attending any regular school.

News-
papers
and
books.

176. The number of newspapers and periodicals published in the State in 1911 was 47 with a total circulation of 35,898, against 24 and 18,082 respectively in 1901. Journalistic activity has thus nearly doubled during the decade and may be taken as indicating a corresponding increase in the thirst for general information and knowledge on the part of the literate public. The progress in journalistic output has been greater in Kanarese than in English publications. The former also enjoy a larger circulation in the aggregate, although it must be said that the latter are taken to more largely by the English-knowing classes.

The total number of books published during the past decade was only 733 as compared with 1,327 in the previous decade (1891-1900), although the output in the English language in particular shows a remarkable increase. Literary activity has, however, set in with renewed vigour since 1909, as will be seen from the figures of Subsidiary Table X.

SUBSIDIARY TABLES.

CHAPTER IX.

LANGUAGE.

177. "Enter the language which each person ordinarily uses in conversation, with his mother or other near relation. In the case of infants and deaf-mutes, the language of the mother should be entered." These were the instructions issued to enumerators with regard to the entries in the 'Language' column of the Census Schedule. A variety of names for each language and dialect, *e.g.*, Arava for Tamil, Are for Marathi, Andhra for Telugu was returned in a few cases but in the case of obvious synonyms (*vide* remarks contained in para 188 *infra*) the ordinary name was retained for the statistics of Imperial Table X (Language). The grouping of languages and dialects according to the results of the Linguistic Survey of India has been prepared and the results exhibited in Subsidiary Table 1 (*b*) appended to this chapter. The entries in the Schedules were generally found to be accurate.

178. Imperial Table X contains statistics of Mother-tongue according to the Census Returns. The following Subsidiary Tables are given at the end of this chapter:—

- (i) Subsidiary Table 1 (*a*), showing distribution of total population by language according to Census. The table indicates the number of speakers of a language per mille of population of the State and mentions the localities where each tongue is chiefly spoken.
- (ii) Subsidiary Table 1 (*b*), showing distribution of total population by language according to Linguistic Survey. The arrangement of the table is similar to that of 1 (*a*).
- (iii) Subsidiary Table II, showing distribution by language of the population of each District and City. Besides the vernaculars of the State, the following languages are included in the Table—Lambani, Tulu and English; the other languages are grouped under a common heading 'others.'
- (iv) Subsidiary Table III, showing comparison of Caste and Language tables. Koracha, Korama and Lambani are the Castes dealt with.
- (v) An additional Subsidiary Table III-A has been given to show side by side language, birthplace and caste figures with regard to a few selected languages.

179. A diagram is given at the end of this chapter to show the distribution of vernaculars of the State in the districts and cities.

180. For the State including Civil and Military Station, Bangalore, the number of persons speaking the vernaculars of the State is 5,691,625; those speaking the vernaculars of India foreign to the State number 99,323; 1,706 persons speak vernaculars of Asiatic Countries beyond India, while 13,539 individuals speak European Languages. The marginal statement gives similar details for (1) the State excluding Civil and Military Station, Bangalore,

Division	Vernaculars of the State	Vernaculars of India foreign to the State	Vernaculars of Asiatic Countries beyond India	European languages
1. Mysore State, excluding Civil and Military Station, Bangalore ...	5,600,405	99,076	1,589	5,589
2. Eastern Division ...	4,238,573	25,611	1,051	4,748
3. Western Division ...	1,361,832	72,465	635	511
4. Civil and Military Station, Bangalore ...	91,220	1,217	117	8,250

(2) the Eastern Division, (3) the Western Division, and (4) Civil and Military Station, Bangalore. It will be noticed that the Civil and Military Station, Bangalore, has more than half the total number of those who speak European

182. The statement here given shows the details of speakers of the vernacu-

Language	1871	1881	1891	1901	1911
Total Population ...	10,000	8,281	9,779	10,937	11,485

Hindustani ...		458	465	532	604
Marathi ...		194	129	154	155
Tamil ...		258	315	448	477
Telugu ...		1,260	1,487	1,652	1,819
English ...		16	20	20	26

* Calculated after including in the number those returned as speaking Hindi and Urdu.

lars of the State and English at the several censuses assuming the population of the State to have been 10,000 in 1871. The increase of persons speaking Kanarese and Telugu is marked in the decennium 1881-1891; the increase of persons speaking Tamil and Marathi is noticeable in 1891-1901; and the increase of English speakers is conspicuous in 1881-91 and 1901-11.

The numbers speaking the vernaculars of the State and English at each of the Censuses 1881-1911.

183. The number of speakers of the principal families, branches and groups of

Language	Persons
Total number of speakers ...	5,806,193
Dravidian family ...	5,348,859
Dravida Group ...	4,429,449
Andhra Group ...	919,410
Indo-European Family ...	418,266
Indian Branch ...	393,335
Eranian ...	1,390
European ...	13,536
Armenian and Singhalese ...	5
Semitic Family ...	303
Mongolian Family ...	17
Tibeto-Chinese Family ...	15
Unclassified Languages ...	43,738

languages returned for the State are shown in the subjoined statement. From this it will be seen that the Dravidian family of languages accounts for 92 per cent of speakers, the Indo-European family for 7 per cent and the unclassified languages for nearly one per cent.

Language distribution according to linguistic survey.

(a) *Dravidian Family*.—The languages of the Dravida group are Kanarese (4,147,765), Tamil (241,947), Tulu (31,995), Malayalam (4,692) and Coorgi (50). Of these, the first two are the vernaculars of the State and Tulu is the chief language spoken by the periodic immigrants to the Western Division from South Kanara. Mysore is the home of the Kanarese language, the 'Karnata' of the Hindu geographers and historians. Telugu (919,410) comprises the Andhra group and is next to Kanarese, the most widely spoken language in the State. It is markedly prevalent in the Kolar, Bangalore and Tumkur Districts in the order mentioned; and in fact in the first-named District (Kolar) the Telugu speakers number more than twice the speakers of the Kanarese language.

(b) *Indo-European Family*.—The chief languages of the Indian branch are Western Hindi or Hindustani (305,182) and Marathi (87,472) which are both of them the vernaculars of the State. The chief language of the Eranian group is Persian (1,384). English is the principal language of the European branch and is spoken by 13,120 persons.

(c) *Unclassified Languages*.—The only other widely spoken language is Lambani which is spoken by 43,667 persons.

184. (1) *Kanarese*.—This language is spoken by 714 per mille of the population in the State. The accompanying statement shows the numbers speaking the same in each district and the percentage they bear to the population of the unit concerned. Mysore, Hassan, Kadur and Shimoga Districts return more than four-fifths of their populations as Kanarese speakers. In the Kolar District, Telugu displaces Kanarese as the principal mother-tongue. The proportion of

Vernaculars of the State; their distribution.

District or City	Number returning Kanarese as mother tongue	Percentage to population
Bangalore City ...	27,786	31
Bangalore District ...	456,193	64
Kolar Gold Fields (City) ...	356	1
Kolar District ...	188,526	25
Tumkur District ...	577,762	79
Mysore City ...	37,255	52
Mysore District ...	1,194,956	94
Chitaldrug District ...	411,732	78
Hassan District ...	537,575	91
Kadur District ...	269,441	80
Shimoga District ...	420,342	81
Civil and Military Station, Bangalore.	5,826	6

Kanarese speakers is very low in the cities, being most marked in Kolar Gold Fields and the Civil and Military Station, Bangalore. Mysore District (including Mysore City) contains 29 per cent of the Kanarese speakers in the State, Tumkur District 14 per cent, Bangalore District (including Bangalore City and Civil and Military Station) and Hassan District 13 per cent each, Chitaldrug and Shimoga Districts 10

per cent each, Kadur District 6 per cent and Kolar District (including Kolar Gold Fields) 5 per cent.

(2) *Hindustani*.—Hindustani “is not only a local vernacular, but is also spoken over the whole of the north and west of continental India as a second language, a *lingua franca* employed alike in the court and in the market-place by every one with any claim to education.”* The modern Indo-Aryan vernacular of the old Midland or the Gangetic Doab and its country to the north, is the Western Hindi, the principal dialect of which is Hindustani. This dialect was in general use in Delhi and from there it was carried everywhere in India by the lieutenants of the Mughal Empire. The Musalmans employed the Persian character for recording it and enriched its vocabulary with a large stock of Persian and Arabic words. This Persianised form of Hindustani is known as Urdu. The Hindu form of Hindustani is more or less Hindustani for the use of Hindus and was derived from Urdu by ejecting all words of Arabic and Persian birth and substituting in their place words borrowed or derived from the indigenous Sanskrit. Hindi is generally written like Sanskrit in the Devanagari character. While Urdu is enlisted into the service of both prose and poetry, Hindi is employed only for prose. The name ‘Hindustani’ when connoting any particular form of speech is properly reserved for a language whose vocabulary is neither excessively Persianised nor excessively Sanskritised. The speakers of Hindustani number 53

District	Number of Hindustani speakers	Percentage to total Hindustani speaking population
Bangalore District	48,767	16
Bangalore City	10,986	4
Bangalore Civil and Military Station... ..	23,101	8
Kolar District	47,856	16
Kolar Gold Fields (City)	2,809	1
Tumkur District	34,839	11
Mysore District	33,710	11
Mysore City	13,098	5
Chitaldrug District	24,289	8
Hassan District	16,587	5
Kadur District	15,004	5
Shimoga District	33,676	11

per mille of the population of the State. The marginal statement shows the number of speakers in each District and City and gives the percentage that the number bears to the total of Hindustani speakers in the State. Among the Districts, Kolar and Shimoga have each a little more than 6 per cent of their populations speaking Hindustani, while Mysore has only about 3 per cent. Of the Cities, Civil and Military

Station, Bangalore, has nearly 23 per cent of its population speaking Hindustani, Mysore City 20 per cent, Bangalore City 12 per cent, and Kolar Gold Fields only 5 per cent.

(3) *Marathi*.—The marginal statement shows for Districts and Cities the percentage of Marathi speakers of the unit concerned to the speakers of Marathi in the State. It is noticeable that Bangalore District (including the City and the Civil and Military Station) and Shimoga District contain 50 per cent of the number of Marathi speakers in the State, who themselves form a little more than one per cent of the whole population.

Dravidian languages, plentiful in vocabulary, and cultivated from a remote period”† is spoken by 4 per cent of the population of the State. The distribution of the speakers is as in the margin. Of the cities, 77 per cent of the population of the Kolar Gold Fields speak Tamil; the Civil and Military Station, Bangalore, has 42 per cent of its inhabitants Tamil speakers and 22 and 11 per cent of the populations of the Cities of Bangalore and Mysore have returned Tamil as their mother-tongue. Of the Districts, Bangalore and Kolar are the only Districts having more than 6 per cent of their populations speaking Tamil; on the other hand, Shimoga and Chitaldrug return less than one per cent Tamil speakers.

* Imperial Gazetteer of India, Vol. I, p. 385.

† Imperial Gazetteer of India, Vol. I, p. 380.

(5) *Telugu*.—Next to Kanarese, Telugu is the most widely spoken language in the State; nearly 16 per cent of the population speak it. Of the Telugu speakers, as many as 93 per cent live in the following four districts, Kolar (including Kolar Gold Fields) (48), Bangalore (including Bangalore City and Civil and Military Station, Bangalore) (21), Tumkur and Chitaldrug (12 per cent each). Telugu "the only important Andhra language, * * * has an extensive literature written in a character of its own, * * * which owes its numerous curves to the fact that it has been written on palm leaves."*

185. Of the other languages it will be sufficient if the local distribution of those which have in each case more than 1,000 speakers for the State be considered. Other languages.

(1) *Gujarati* (2,679).—This language is spoken in all the Districts: Of the Cities, the Civil and Military Station, Bangalore, has 301 speakers, Mysore City 278 and Bangalore City 179.

(2) *Konkani* (9,358).—This dialect of Marathi is spoken chiefly by the immigrants from the Konkan who are mostly found in Kadur (3,736) and Shimoga (4,971) Districts.

(3) *Koracha* (2,739) is spoken by Korachas, chiefly in Chitaldrug, Kolar and Bangalore Districts.

(4) *Korama* (1,049) is spoken mostly in Kolar, Kadur and Bangalore Districts.

(5) *Lambani* (43,667).—The Lambani speakers are chiefly found in Shimoga (16,239), Chitaldrug (7,620), Kadur (7,531) and Bangalore (4,243) Districts.

(6) *Malayalam* (4,692).—Nearly one half of the speakers are on the Kolar Gold Fields Area (2,138). The districts having above 500 speakers are Kadur (692) and Hassan (610).

(7) *Marwari* (1,247).—Marwari is chiefly spoken in Shimoga District (256), Kolar District (217), Civil and Military Station, Bangalore (209), Chitaldrug (154) and Kadur (146) Districts.

(8) *Tulu* (31,995).—The speakers are mostly immigrants from South Kanara. Kadur District has as many as 21,976 speakers, Shimoga District 5,265 and Hassan 4,518.

(9) *Persian* (1,384) is spoken chiefly in the Bangalore District (450), Hassan District (251) and Kolar District (210). The tongue may have been in most instances a Persianised form of Hindustani but styled Persian.

Trade or travel accounts for most of the other languages returned in Imperial Table X.

186. This language has been returned as mother-tongue by 13,120 persons in the State. On a reference to Imperial Table XIII, (caste, tribe or race) we find the number of Anglo-Indians, Armenians and Europeans to be 13,290. Deducting from this figure, the number of speakers of European languages (who it is presumed belong to the races mentioned above) other than English (except Turkish) we get the number of Anglo-Indians, Armenians and Europeans, who may be expected to have returned themselves as speaking English. The working is as in the margin. The difference between those returned in Imperial Table X as speaking English and this figure is 13,120—

Danish	...	9
French	...	130
Gaelic	...	1
German	...	40
Greek	...	1
Hungarian	...	2
Irish	...	1
Italian	...	102
Portuguese	...	125
Welsh	...	7

$$13,290 - 418 = 12,872$$

12,872 = 248. This number is scarcely 2 per cent of the number of English speakers. A reference to Imperial Table IX shows that 10,264 Anglo-Indians, Armenians and Europeans are literate in English. The total number of persons literate in English for the State is 40,641. Therefore as many as 40,641 - 10,264 = 30,377 persons not belonging to these races and more than twice as many as those who returned the language as mother-tongue are found literate in English. English is not only the official language, it is the language of science and literature, of scholarship and art, of commerce and business and that is why—because

* Imperial Gazetteer of India, Vol. I. p. 391.

it is the key to all knowledge—it has the unique distinction of commanding the literacy of more than thrice the number of persons who use it as their mother-tongue.

Dialects.

187. The following are the principal dialects returned in the present Census.

- | | | |
|------------------------|---|---|
| (1) Koracha. | { | are dialects of Tamil spoken by the Animist tribes of the same name. |
| (2) Korama. | | |
| (3) Multani (7). | | dialect of Western Panjabi or Lahnda spoken in Bangalore City. |
| (4) Goanese (5). | { | dialects of Marathi. Konkani is said to differ so widely from standard Marathi that some of its speakers claim for it the dignity of a separate language. The Kanarese alphabet is generally employed for recording Konkani. |
| (5) Konkani. | | |
| (6) Rajputani (1). | { | dialects of Rajasthani. Marwari is the western dialect of Rajasthani and its speakers who are enterprising merchants and bankers, have carried it all over India. It "has a copious literature, written in a peculiar character, the aspect of which is familiar to every Indian official who has had occasion to inspect the accounts of native bankers." |
| (7) Marwari. | | |
| (8) Memani (2). | { | dialects of Gujarati. |
| (9) Nagari (43). | | |
| (10) Patnuli (52). | | |
| (11) Ladar (66). | { | are included under Gipsy languages. These Gipsy languages have nothing to do with European Romani. "Some are mere thieves' jargons, others are hybrids, developed in journeys from place to place, and some are real dialects of well known languages."† Lambani which also passes under various names such as Lambāni, Lahhāni or Banjāri, "is the language of the Lahhanas or Banjarnas, the great carrying tribe of Southern India. So far as the enquiries of the Linguistic Survey have yet gone, their tribal tongue seems to be based on "Western Rajasthani" (India Census Report, 1901). |
| (12) Lambani (43,667.) | | |

**Dialects—
continued.**

188. Most of the dialects mentioned in the foregoing paragraph are dialects of languages spoken more or less by immigrants and concern vernaculars foreign to the State. Resort is had generally to the language from which the dialects are derived when these are not intelligible. Dialect does not seem to be a question of sex. So also it cannot be said that caste differences have produced true linguistic differences. It is true that residence in a place where a different language is widely spoken, tends to produce, in respect of a language, loss of its proper accentuation, of its inflectional suffixes and also in a few cases of its idioms, *e.g.*, the spoken Tamil of the Vaishnavas in Mysore is hardly the Tamil of Madura; and the spoken Hindustani of Bangalore may not be considered elegant in the Court of Hyderabad. It is true also that there are sure to be little differences in style and accent when the same language is spoken in different districts, *e.g.*, the Kanarese of Mangalore is not considered orthodox by the Kanarese speakers of Mysore. The pronunciation of the low caste man may sound queer to the high caste speaker of the same language. In colloquial language, strict grammar is considered *a purism* and women and children do not generally correctly articulate the gutturals, nasals, sibilants and the aspirants. But these peculiarities of a language engendered by (1) the speakers' domicile in the midst of speakers of other languages, (2) by the same language giving way to local predilection in point of intonation and style, (3) by the articulation of the same language by different castemen and (4) by use in ordinary colloquy specially by females and children, surely do not amount to differences which alone mark one dialect from another and both from the principal language. The Kanarese and Urdu newspapers in the State adopt the style and idioms of the languages as prevalent here. Kanarese and Urdu are being taught in public schools. The school books of the Primary classes are written in intelligible Mysore Kanarese and in easy Urdu. The State being compact in size, there are no great local differences in the form of speech.

**Tribal
languages.**

189. Koracha, Korama and Lambani are the three tribal languages returned in the present Census. These are spoken by the tribes of the Sānie names. As regards the names Koracha and Korama, the Officer in charge of Ethnographic Survey opines in his monograph on the Koracha caste that "there is strong reason

* Imperial Gazetteer of India, Vol. I, p. 368.

† Imperial Gazetteer of India, Vol. I, p. 389.

to hold that the names (Koracha and Korama) are mere local variations for one and the same caste. The exogamous divisions among them and family names wherever they are found * * * * are all common to both the branches, who moreover speak the same language." These tribes "speak a language which appears to be a dialect of Tamil or a medley of Tamil, Telugu and Kannada, the first element preponderating." In the light of these remarks it seems best to take the two names together, whether in the case of the tribe or the language and combine the figures of 1901 for Koracha and Korama (and Korava) for the purposes of comparison. Doing this, we find as follows:—

Tribe	Strength of tribe	Number speaking tribal language
Koracha or Korama	(1901 ... 24,228	2,688
	(1911 ... 26,988	3,788

Many members of the tribe return their language as Tamil.

Similar information for Lambanis is embodied in the statement given below:—

Tribe	Strength of tribe	Number speaking tribal language
Lambani	(1901 ... 45,579	35,301
	(1911 ... 51,163	43,667

The reason why such a large number speaking the tribal language is returned among Lambanis as distinguished from Korachas, seems to be that the Lambanis cannot very easily designate their language with the name of any well-known Vernacular whereas the Korachas can easily do so, *i.e.*, call their language Tamil, Telugu or Kanarese.

190. "The superior power of resistance of Tamil, Telugu and Kanarese to the advance of the Sanskritic languages is probably due mainly to the fact that they have their own written character and religious and secular literature and that all sections of the community, including the great majority of the Brahmans, are of local origin."* The Kannada character is the same as the Telugu, and ~~Kannada~~ ^{The Kanarese language.} seems to have been a generic term which formerly included both. There is an extensive literature in the Kannada language going back to great antiquity. Down to about A. D. 1300 the language was cultivated entirely by the Jains; from that period to A. D. 1500, the Lingayats continued its use in literature and thenceforward Brahmans and other sects took part in its cultivation. The importation of Sanskrit terms latterly found great favour and there is a natural reaction against the same. Many English terms notably relating to Revenue and Civil Law, are being daily used by Kanarese speakers most ignorant of English Language. In the domain of Science, Kanarese translations of English terms are sometimes unintelligible and probably will have to yield to adaptations of the terms themselves. The script and language of correspondence of English-knowing Indians is most often English, so that thinking in the vernacular and vernacular composition are almost the monopoly of scholars. The public taste is not very favourable to the flourishing of real Kanarese composition. Apart from school books, easy stories from old works or songs written in colloquial Kannada are most in demand. The reading public, who are fast becoming a minority, care more for English novels and periodicals if they cannot or prefer English. Adaptations from favourite English authors are attempted by Kanarese writers, even these, though successful from a literary point of view, are not very popular with the authors, because to the English-knowing public, through the influence

* Census Commissioner's notes for Chapter III of Report, page 1.

familiar, the vehicle of thought seems unusual whereas to the non-English-knowing public, the ideas are foreign though the diction is fairly acceptable. So original work may be said to be more or less comparatively rare. Laudable efforts are being made in parts of the country (1) to standardize and regulate the influx of foreign words into the vocabulary and (2) to give an encouragement to authors. In this lull of public demand, it remains to be seen how far these efforts will be successful. A study of Sanskrit, the language of the Vedas and sacred books, claims the attention of many students and this again reacts on the taste for the vernacular.

Proportion of female speakers to male speakers of the vernaculars of the State.

191. The following statement shows the number per 1,000 males, of female speakers of each vernacular:—

No.	Language						Number of female speakers to 1,000 male speakers
1	Kanarese	995
2	Hindustani	918
3	Marathi	928
4	Tamil	927
5	Telugu	986

Similar information for the Civil and Military Station, Bangalore, Eastern and Western Divisions, is given below:—

No.	Language			Number of female speakers to 1,000 male speakers in		
				Civil and Military Station, Bangalore	Eastern Division	Western Division
1	Kanarese	1,015	1,000	985
2	Hindustani	870	923	919
3	Marathi	886	935	920
4	Tamil	1,026	914	855
5	Telugu	995	987	954

Correlation of figures for language, birth-place, and caste, tribe or race.

192. It has been remarked in the Mysore Census Report of 1901, while controverting an opinion expressed in the report for 1891, that mother-tongue is more dependent on racial and tribal characteristics than on birthplace. Let us examine this statement with reference to a typical language Hindustani. Taking the tribes that are generally presumed to speak the language Hindustani—the tribes of Musalmans—we find the following discrepancy:—

	Persons	Males	Females
Hindustani speakers	305,182	159,136	146,046
Musalmans (presumed to be Hindustani speakers)	314,494	165,824	148,670
∴ Excess of Musalmans over Hindustani speakers	9,312	6,688	2,624

Even deducting from this the number of Musalmans who may be presumed to speak Memani, Pashto, Arabic, Persian and Turkish, i.e., 1,686 persons (929 males and 757 females), we have an excess of 7,626 persons (5,759 males and 1,867 females). It may be said that the tribes of Mapilla, 2,257 persons (1,989 males and 268 females) and Labbai 7,995 persons (5,200 males and 2,795 females) include some who are speakers of Malayalam and Tamil as they come mostly from Malabar and North Arcot respectively. But here we are going back on the argument of birthplace to support that of racial and tribal characteristics. Again

how many of these may be Hindustani speakers? It is simply impossible to make a general statement. We find as a fact that some Pinjaris (Musalmans) have returned themselves as speaking Kanarese in Chitaldang District. Here the racial characteristic does not indicate a language. The fact is that the evolution of language, is too subtle to be gauged by such considerations as racial and tribal characteristics or birthplace. One or more of these may co-exist with any other and sometimes a startling coincidence may ensue, for example the existence in the present census figures of four Japanese speakers, one male and three females (Imperial Table X), of four persons born in Japan (Imperial Table XI) and of four Japanese Buddhists (Imperial Table XIII). Such coincidences are not at all of value sufficient to enable general inferences being drawn as to the relations of causation and effect of the three attributes—language, caste, tribe or race, and birthplace.

193. Language is the expression of human thought, and as such grows with the progress of human thought, in proportion as the latter progresses, either by cultivation or by contact with better culture. During such an expansion, human thought must, in some instances at least, overcome the predilections of racial and tribal characteristics and of birthplace and may take for its expression a convenient language adapted to its needs. It depends on the circumstances of each case—the tie of nationality, tribe or caste, the superiority of language to hand, the drawbacks of the original language, the purpose sought to be attained, the better adaptability of the local language to subserve the material and moral condition of progress of the race, etc., concerned, how far the language of the birthplace, the language of the tribe or race, or the language of the locality will prevail. The time has gone by when it was the fashion to trace a common origin to races the languages of which showed remarkable affinities. Just as language is a human necessity, so also similarities in the structure of languages must result from men working out their civilization in parallel lines. We see in many Marathi, Tamil and Telugu speaking households the younger generation more familiar with Kanarese than with the mother-tongue. When these grow up to be men and women, who knows but they may not use Kanarese as their tongue? This paragraph may be aptly concluded with a few quotations bearing on the matter from the Imperial Gazetteer of India, Chapter VII, (Language). “The Dravidian race is widely spread over India but all the members of it do not speak Dravidian languages. In the North many of them * * * have adopted the language of their conquerors while they have retained their ethnic characteristics. Dravidians are almost the only speakers of two other important families of speech, the Munda and the Dravidian proper * * *. Whether we consider the phonetic systems, the methods of inflexion or the vocabularies, the Dravidian have no connection with the Munda languages.” In fact language seems to be beyond the pale of any conscious human policy. We may take as an example, the case of Sanskrit which may be said to be the polished form of the archaic dialect of the upper Doab, the language of the Rig Veda. “It received literary culture from the most ancient times and became fixed by the labours of grammarians which may be said to have culminated in the work of Panini about the year 300 B.C.” “Just as the spoken dialects of Italy existed side by side with Latin, and while the evolution of Latin was arrested by its great writers, ultimately developed into the modern Romance languages, so the ancient Vedic form of speech developed first into that stage of language known as Prakrit and then into one or more modern Indo-Aryan vernaculars.”

The Evolution of language.

CHAPTER X.

INFIRMITIES.

194. The infirmities regarding which information was collected during the **General** present Census, were, as in 1901, (1) Insanity, (2) Deaf-mutism (from birth), (3) Blindness (total) and (4) Corrosive leprosy. The instructions issued to enumerators on this occasion were also similar to those issued on the previous occasions and were as follows:—

“ If any person be blind of both eyes, or deaf and dumb from birth, or insane or suffering from corrosive leprosy, enter the name of the infirmity in this column. Do not enter those who are blind of one eye only, or who have become deaf and dumb after birth or who are suffering from white leprosy only.”

There is every reason to believe that the instructions were carefully followed in the districts during the enumeration. The abstraction of the information concerning these infirmities was effected in the present Census (1911) by having special slips written for such individuals and by getting these sorted for Imperial Tables XII and XII-A. The result is that the information collected by the enumerators has been accurately tabulated. With all this, it must be admitted that there are certain considerations, arising from the nature of the case, which apply with peculiar force to the accuracy of the statistics of the infirmities with which we are now dealing and the chief of these are:—(1) The information demanded of householders regarding the column of infirmities in the Census Schedule, involves, in cases where the specified infirmities exist, the admission, which one will not willingly make, of the existence of serious and loathsome diseases. Again “ Hope rises eternal in the human breast ” and if there is the slightest chance of recovery, the existence of the disease is denied. This consideration weighs least in the case of blindness. The reticence is more in the case of afflicted females than in the case of males and more in the case of the young and adolescent than in the case of the old. (2) The diagnosis of the householder or of the householder aided by the enumerator may be wrong. Just as fever is in the language of the ignorant the usual name for general bodily distempers, so in common parlance, any continued mental or nervous affection may be styled ‘ insanity ’ *e.g.*, hysteria may be confounded with insanity. Just as there is a tendency to return the ages of elderly women as at least a score of years more than their proper age, so dimness of sight in old people may be described as blindness. A retarded development of speech in a weak-headed archin may not unfrequently be regarded as dumbness while very few non-medical men know that deaf-mutism is the consequence of congenital deafness or complete deafness arising in very early infancy and that the affliction cannot result in after life. Syphilis, scrofula or crisympelas may be taken for leprosy. For instance, “ the leprosy commission found that of the persons produced before them as lepers by police inspectors and other non-medical men, about 10 per cent were suffering from diseases other than true leprosy. The error must be still greater when the diagnosis is made by the simple villagers from whose ranks most of our enumerators were drawn.” *

195. After this preliminary caution, so essential for a true criticism of the **Statistics**, figures, we shall point out where the statistics are to be found.

- (1) Imperial Table XII, Part I, gives for (a) the State including, and (b) the State excluding, the Civil and Military Station, Bangalore, the distribution by age-periods of the infirm. Part II gives the distribution by divisions, districts and cities. A few unfortunate persons

have been found to be afflicted with two or more infirmities. Information regarding these individuals is given in a separate statement at the foot of the table, in which, it may be added, such persons have been shown under each of the infirmities but have been reckoned singly for the purposes of the total afflicted.

- (2) Imperial Table XII-A gives details of the infirms according to caste, tribe or race for (a) the State including, and (b) the State excluding, Civil and Military Station, Bangalore. The population of the caste, etc., is given in a separate column so as to assist in forming an opinion about the significance of the figures.

196. The proportional figures worked out from the absolute figures are exhibited in the following Subsidiary Tables:—

- (i) Table I, showing the numbers afflicted per 100,000 of the population at each of the last four Censuses, for the State, divisions, districts and cities.
 (ii) Table II, showing the distribution of the infirm by age-periods per 10,000 of each sex.
 (iii) Table III, showing the number of afflicted persons per 100,000 of each age-period and also the number of females afflicted per 1,000 males.
 (iv) Table IV, showing the number afflicted per 100,000 persons of certain castes, etc., and the number of females afflicted per 1,000 males.

197. The statement A given below shows the number of infirms in the State at each of the Censuses 1871, 1881, 1891, 1901 and 1911. The total population at each period is also given. The proportion per 100,000 at each of the Censuses can be seen from the following statement B. (The figures for 1901 are adjusted by including cases of combined infirmities under each of the infirmities concerned.)

Infirmity	Number in				
	1871	1881	1891	1901	1911
Total population ...	5,055,402	4,186,188	4,943,604	5,539,399	5,806,193
Insanity ...	2,980	767	1,089	1,032	1,334
Deaf-mutism ...	6,070	2,610	3,466	3,055	4,472
Blindness ...	7,933	3,926	5,250	4,049	5,749
Leprosy ...	1,497	533	814	672	767

Proportion per 100,000 in	Insane		Deaf-mute		Blind		Lepers	
	Males	Females	Males	Females	Males	Females	Males	Females
1871 ...	61	57	123	117	155	159	36	23
1881 ...	22	14	68	56	89	98	16	9
1891 ...	25	19	78	62	108	105	22	11
1901 ...	21	16	62	48	79	67	17	8
1911 ...	26	20	86	68	104	94	18	8

It will be noticed that there has been a sudden fall in the numbers of the infirms in the Census of 1881, a rise in 1891, a fall in 1901 and a rise again in 1911. Examining the material conditions of each decade, we find that the famine of 1876-7 carried off nearly a million of human lives and accounted for a reduction of the infirms from 18,480 persons in 1871 to 7,836 persons in 1881. In the next Census (1891) there was a general increase in every infirmity as compared with the preceding Censuses. In 1901 there is a decrease again; the reason for this decrease which is marked is not apparent. The large decrease in India generally in 1901 was attributed in many Provinces to the two great famines

Proportional figures.

The number of infirms at each Census.

(1896-97 ; 1899-1900) which naturally bore most heavily on persons dependent on charity, as most of the infirm are. (*Vide* the summary given in the Imperial Gazetteer of India, Volume III, pages 501-2, of the famine and scarcity conditions in India since 1769.) None of these extreme conditions affected the Mysore State during the decade, but still there has been a fall in the numbers. Perhaps the figures of 1901 have to be taken with some modification inasmuch as the process of abstraction in 1901 was not uniform in the case of all districts in the State, *e.g.*, in the case of Bangalore, Kolar, Tunkur and Chitaldrug Districts, the infirmity tables were—

“all got up simultaneously by the tick-system. A section consisting of 7 men was formed, one of whom was the Supervisor and the rest tickers. Four of these were asked to note down the various particulars relating to the infirms required for the above tables (XII, XII-A, XII-B, religion and civil condition of the infirm and XII-C literacy and occupation of the infirms), while the fifth read and the sixth simply noted the number of the entry. The results as tested afterwards by sorting have also proved the correctness of the result obtained under the tick-system.” (Mysore Census Administrative Report, 1901, page 276.)

In the case of Mysore, Hassan, Kadur and Shinoga Districts, “The slips relating to the infirms were sorted; but * * * it was found that the infirm slips were much fewer in number than the afflicted population counted at the examination of the schedules. * * * By the frequent stitchings which the schedule books had undergone in the course of the examination of the returns and the serial numbering thereof, several of the short infirmity entries had got hidden into the stitch and escaped the notice both of the slip-writer and of the checker. Thereupon the schedule books were opened out and a separate set of slips was copied out, in respect of the whole of the infirm population.” (Mysore Census Administrative Report 1901, page 299.)

198. Thus, in the absence of any reason being assigned for the fall in 1901 and owing to want of uniformity in the methods of abstraction adopted then, it must be said that the figures of the present Census have, in order to convey a correct idea, to be compared not only with the figures for 1901 but with the figures of other Censuses as well. Improvement in the material condition of the people, better sanitation and (especially in the case of blindness) cures effected with the aid of modern medical and surgical science, have brought down the rate of increase very considerably, as compared with the figures of 1871. The operation of these causes has had so far a negative effect because in India the institution of marriage is as open to afflicted persons as to ordinary people. The use of a special infirmity slip was resorted to on the present occasion (*vide* para 195 *supra*) and to the greater accuracy of tabulation resulting therefrom may also be ascribed a slight increase.

The number of Infirms at each Census (contd.)

INSANITY.

199. Taking the case of insanity, we have the numbers comparing as follows:—

Statistics of insanity examined.

Insane	1871	1881	1891	1901	1911
Persons	2,980	767	1,089	1,032	1,334
Males	1,546	466	628	601	764
Females	1,434	301	461	431	570

The proportion of females to 1,000 afflicted males in each Census is given below.

Insane	1871	1881	1891	1901	1911
Proportion of females to 1,000 males afflicted	928	646	734	717	746

According to the figures furnished for the Lunatic Asylum, Bangalore, there were 270 lunatics there on 31st December 1901 against 180 on 31st December

1911, the numbers of criminal lunatics on the same dates being 42 and 24 respectively. The excess number in 1901 is due to observation cases of alleged insane persons being included as insane as was in vogue prior to 1904. An analysis of admissions according to localities in the State is embodied below.

District	Number of insanes (Imperial Table XII)	Admissions in 1911	Remarks
Bangalore District, including City ...	345	30	179 who were under treatment at the Asylum are included in the figures for Bangalore District.
Kolar District, including Kolar Gold Fields (City) ...	198	6	
Tumkur District ...	121	4	
Mysore District, including City ...	234	6	
Chitaldrug District ...	171	1	
Hassan District ...	79	3	
Kadur District ...	44	1	
Shimoga District ...	130	1	
Civil and Military Station, Bangalore ...	12	14	

Regarding the causes of insanity, the following remarks are taken from the report on the working of the Lunatic Asylum during the year 1911:—

"Taking the admissions of the last decade (1901-10) there were altogether 596 admissions, of whom the cause of insanity was known in 283 cases, 56 being due to moral causes and 227 to physical. Out of the latter, intoxicants, *e.g.*, alcohol and *ganja*—contributed 83 or 36·56 per cent, epilepsy 38, congenital or hereditary 17, masturbation 14, child-birth 11, overstudy 7 and other physical causes 57." "It may be noted from the figures of the 'remaining' column under *ganja* and spirit in Statement VII, that there are more under '*ganja*' than under 'spirit,' showing that the different types of insanity due to '*ganja*' tend to become chronic and are not easily curable whereas those due to 'spirit' get well and the persons so affected will become useful members of society."

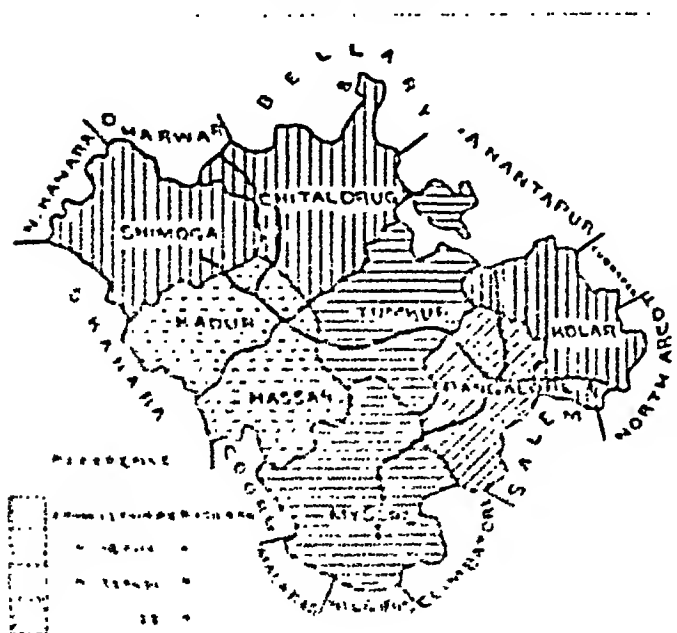

2001. The accompanying inset map shows the proportion of the afflicted to the

total population of each district in the present Census. It will be seen that the proportion is the highest in Bangalore District (including Bangalore City and the Civil and Military Station, Bangalore), and lowest in Kadur District. The proportion in Bangalore City even after deducting the number of lunatics born outside Bangalore District and enumerated in the Lunatic Asylum, works up to 152 males and 117 females, per 100,000 of the population. (Vide note to Subsidiary Table I. This may be due to the ignorance on the part of the guardians of alleged lunatics, of the rule that on an order being passed by the District Magistrate

Distribution of the insane by locality.

Shows the proportion of the insane to the total population of each District.

... to observe the person, before the ... of Bangalore, in consequence of ... to Bangalore City for obser- ... of districts in each Census,

beginning with the lowest according to the proportion of the insane per 100,000 of population.

District	Number indicating order beginning with the lowest according to proportion of insane per 100,000 of population in				
	1871	1881	1891	1901	1911
Kadur District	1	4	3	1	1
Hassan District	2	1	2	2	2
Mysore District including City ...	3	2	4	4	4
Bangalore District including Civil and Military Station	4	8	8	8	8
Shimoga District	5	7	7	7	5
Tumkur District	6	6	1	3	3
Chitaldrug District	7	5	6	6	7
Kolar District including Kolar Gold Fields (City)	8	3	5	5	6

201. The diagram given in the margin shows the number of persons afflicted per 100,000 persons of decennial age-periods. Separate curves are drawn for males and females at the present and 1901 enumerations. The excess of males over females is most noticeable between the ages of 20 and 50. The numbers of the insane between the ages 10 and 40 form a little more than 60 per cent of the total insane. Comparing the numbers at age-periods 10-15 onwards of the insane at the present Census with the numbers at age-periods 0-5 onwards of 1901, we find that the increases are all between the ages of 10 and 40 of the present Census.

202. The proportionate figure for 100,000 for males only is taken for purposes of comparison as the figures for females may not be so much relied on owing to the chances of concealment of information during enumeration. The highest figure is in the case of tribe of Sheikhs (57) in Musalmans; next come in order Neygi (51), Brahman (48), Kshattriya (47), Indian Christian (45), Pathan (Musalmán) (43), and Mahratta (38). The great cultivating caste of Vokkaliga has 22. The custom of marrying in and in perhaps accounts for the high figure in respect of certain castes, tribes and races. The low proportion of the insane in India as compared with the number of such in European countries is attributed to "the very different conditions of life in the East. In Europe the competition between man and man is severe and is yearly becoming more so. The mental wear and tear is very great and the strain on the nervous system deranges many feeble intellects which in the calm and placid East would escape the storms to which they succumb."*

* India Census Report, 1901, page 184.

DEAF-MUTISM.

203. The numbers for the several Censuses compare as follows:—

Performance					1971	1981	1991	1901	1911
Perf. A.	6,070	2,610	3,486	3,083	4,472
Perf. B.	3,124	1,425	1,937	1,735	2,513
Perf. C.	2,945	1,184	1,629	1,220	1,932

The proportion of females per 1,000 afflicted males in each Census is indicated hereunder:—

Defendant	1871	1881	1891	1901	1911
Proportion of females to 1,000 males afflicted	943	820	739	761	750

"As in the case of other forms of congenital malformation, so also, with deaf-mutes, males in all countries suffer more than females."† The figures of the statement above given illustrate this dictum. That insanity is found to co-exist with deaf-mutism seems probable from the fact that 40 such cases have been found in the present Census.

204. To brighten the cheerless lot of these unfortunates as well as the blind, a school was started in Mysore City in October 1901 which has been doing philanthropic work ever since. In 1904 a hostel was attached to the school wherein inmates are lodged, fed and clothed free of cost. The American method of oral teaching is adopted for teaching the deaf-mutes, and drawing, weaving, sewing, knitting and mat-making are the industries taught them. The blind are taught the three R's by the Braille Method. Music, vocal and instrumental, rattan-work and tape-weaving form part of the curriculum for the training of these. The school is considered as a model institution and in 1908 teachers from Baroda State were deputed to study the methods of instruction imparted here. The handicraft of the pupils has won medals and certificates of merit in the local exhibitions and the Nagpur Exhibition of 1908. The Head Master in charge is a graduate who has made a study of the systems of teaching adopted in the Deaf and Dumb Schools of Calcutta and Bombay. It is interesting to note that in the class for the deaf-mute there were during the official year 1909-10, 14 boys and in the class for the blind 17.

265. The distribution per 100,000 of the population in each district is illus-

MAP OF MYSORE.

Step 4: the proportion of the deaf-route to the total population of each district.

trated in the following proportionate figure ranging from 70 in Kolar District to 87 in Kadur District. It is noteworthy that the variation in this number is not so marked between district and district as in the case of the other infirmities. This points to a general prevalence of the infirmity in all parts of the State.

206. The diagram inserted in the margin shows the curves for both sexes in 1901 and 1911 for persons per 100,000 of population, living at decennial age-periods. The deaf-mutes are generally short-lived as is seen by the rapid fall of the curve from age-period 20-30 onward.

207. Deaf-mutism seems to be more prevalent among Hindus than among the followers of other religions. Among the Hindus, the following castes have the proportionate figure (for 100,000 of population) in the case of males higher than the average (86) for the State:—Panchala (123), Brahman (111), Vodda (107), Agasa (94), Ganiga (94), Vakkaliga (89), Lingayat (88), Madiga (88) and Tigala (88).

District	Number in decennial order of increasing prevalence of deaf-mutism: beginning with the lowest in				
	1871	1881	1891	1901	1911
Baer District	1	5	2	3	8
Shimoga District	2	2	1	2	1
Mysore District, including City	3	1	6	1	5
Hassan District	4	4	2	5	7
Chitaldrug District	5	8	5	7	6
Coorg District, including City and Civil and Military Station	6	1	1	1	1
Tumkur District	7	7	3	8	3
Kolar District, including Kolar Gold Fields (City)	8	6	7	6	2

Consanguineous marriages which are usually favoured by custom among certain Hindu castes may be responsible in some degree for

the occurrence of this infirmity among the progeny. The marginal statement gives the order, beginning with the lowest, in which deaf-mutism was prevalent in districts in the several Censuses.

BLINDNESS.

208. The numbers returned at the several Censuses are given in the following statement:—

Blind	1871	1881	1891	1901	1911
Persons ...	7,933	3,926	5,250	4,049	5,749
Males ...	3,923	1,866	2,673	2,216	3,055
Females ...	4,010	2,060	2,577	1,833	2,694

Significance of the figures

The next statement gives the proportion of females to 1,000 afflicted males at each Census:—

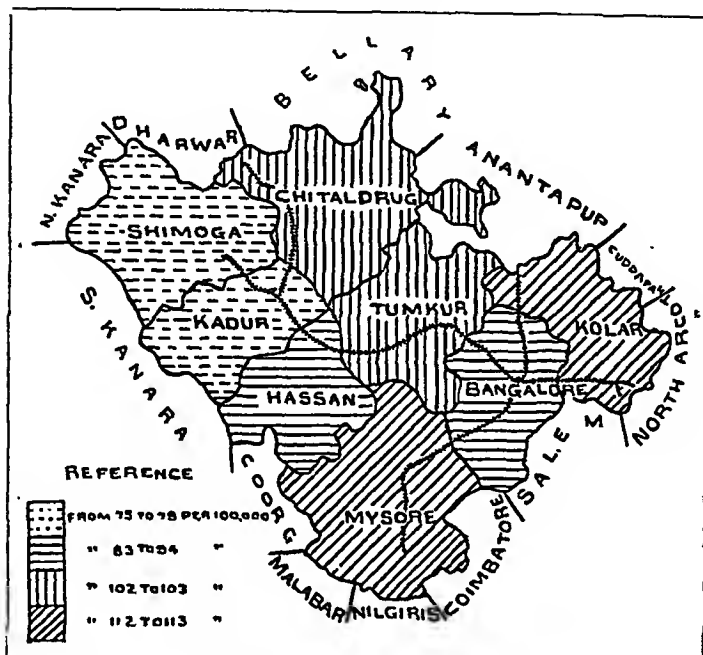

Blind	1871	1881	1891	1901	1911
Proportion of females to 1,000 males afflicted...	1,022	1,104	964	827	882

Curiously enough, the figure for 1881 is the highest, coming as the enumeration does next after the famine of 1876-7. The reason for this phenomenon seems to be that females are better able than males to resist the ill effects of famine.

"The most potent reason seems to be that after reaching maturity women are constitutionally stronger than men, and have, besides, more fat and less muscle in their composition so that they not only need a smaller quantity of food to support their frames but are also better able to endure the wasting process."*

Distribu-
tion by
districts
of the
blind.

209. It will be seen from the inset map given here that the proportion of the blind per 100,000 of the population varies from 75 in the Shimoga District to 112 in the Kolar District and 113 in the Mysore District. Blindness depends more than the other infirmities, on (i) occupation, (ii) habitation and (iii) locality. So far as the statistics of locality are concerned (*vide* the following table which gives the order of districts showing the prevalence of blindness at each Census), they do not admit of any definite deduction being drawn. The proverbially ill-ventilated and ill-lit habitations of rural tracts would naturally be expected to have a very unwholesome effect on the eye-sight of the dwellers but for the

fact that most of these, being agriculturists, spend their time in the open. Continuous and frequent exposure to the glare of the sun and to dust too has its

District	Number indicating order beginning with the lowest, showing prevalence of blindness in—				
	1871	1881	1891	1901	1911
Kadur District	1	3	1	1	2
Bangalore District (including Civil and Military Station and Bangalore City)	2	5	6	5	4
Hassan District	3	2	3	3	3
Mysore District (including City)	4	1	5	7	8
Shimoga District	5	4	2	2	1
Chitaldrug District	6	8	4	4	6
Kolar District (including Kolar Gold Fields City.)	7	7	8	8	7
Tumkur District	8	6	7	6	5

evil effects as is seen by the excessive proportion per 100,000 borne to the average (104) by males of such castes as Uppara (127), Kuruba (126), Agasa (120), Vakkaliga (116), Lingayat (115) and Tigala (113). Sedentary occupations have their effects also, *e.g.*, in the case of males, Neygi (132) and Brahmans (126). Loss of sight owing to small-pox is very rare nowadays considering the extent to which vaccination has been rendered popular

and accessible even in remote parts. Much has been done by the State in recent years to alleviate the sufferings of the eye. An Eye Infirmary, equipped with the

Decade	Cataract operations
1881-1891	72
1891-1901	545
1901-1911	3,008

most up-to-date appliances and directed by a Specialist, has been located at Bangalore and has been doing excellent work. The figures in the appended table show the number of successful cataract operations in the decades 1881-

1891, 1891-1901 and 1901-1911, in the several hospitals and dispensaries in the State.

One fruitful source of loss of vision is the neglect of the common disease Ophthalmia, which comes in every year with the mango season and the 'eye-fly.'

Neglect develops granules and granules impair, in course of time, the vision. Cataract in advancing years is another frequent cause of eye-sight being impaired.

210. The blind after the age of 50 form very nearly one-third of the total

Distribution by age and sex of the blind.

number of blind persons returned. In fact the diagram given shows that the proportionate number (per 100,000) of the blind in age-period '60 and over' is more than twice the number in the preceding age-period. In the actual figures we find that though, for all ages, there are 3,055 males and 2,694 females, after the age 50 there are only 1,011 males and 1,024 females.

"The larger proportion of females at the higher ages seems to be due partly to the fact that females are less ready to seek medical aid and partly to the circumstance that with them congenital blindness is more rare, and there is thus a larger proportion of cases where it is due to external conditions, such as glare, dust and smoke which operate gradually and do not finally destroy the sight until people are well advanced in life. It is also just possible that a certain amount of blindness amongst young girls may have escaped registration."

LEPROSY.

211. The numbers of lepers at each Census are given in the following statement:—

Statistics of leprosy.

Lepers				1871	1881	1891	1901	1911
Persons	1,497	533	814	672	767
Males	912	340	544	463	528
Females	585	193	270	209	239

The proportion of females to 1,000 males afflicted is shown in the margin.

There is a Leper Asylum located in Bangalore City into which any one who seeks admission for treatment is taken. The treatment is regulated according to the necessities of the case.

Lepers	1871	1881	1891	1901	1911
Proportion of females to 1,000 males afflicted.	611	575	496	431	451

Nastin treatment is not adopted; the Senior Surgeon to Government remarked in his Report on the working of the Asylum for 1909:—"After careful enquiry, I find Nastin treatment highly unsatisfactory." The number actually in residence at the beginning of the year 1901 was 17 and at the end of the year 1911, 25.

Local distribution
of leprosy.

212. A reference to the inset map given here shows that the proportion of lepers to 100,000 of population varies from 5 in Hassan District to 23 in Bangalore and Kolar Districts. The relative place of each district from the point of view of the prevalence of the infirmity at the several Censuses is indicated below:—

MAP OF MYSORE.

Showing the proportion of the lepers to the total population of each district.

District	Number indicating order of district, beginning with the lowest showing prevalence of leprosy in				
	1871	1881	1891	1901	1911
Mysore District, including City ...	1	6	5	6	4
Hassan District ...	2	5	6	3	1
Kadur District ...	3	3	1	1	3
Chitaldrug District ...	4	1	4	2	6
Tumkur District ...	5	2	2	4	2
Shimoga District ...	6	4	3	5	5
Bangalore District, including City and Civil and Military Station. Bangalore ...	7	8	7	7	7
Kolar District, including Kolar Gold Fields (City) ...	8	7	8	8	8

From this statement it is seen that the proportion of lepers is highest in the two districts of Kolar and Bangalore at all the Censuses. The chief taluks that show large numbers in these two districts are :—Hoskote (45), Devanhalli (39) and Bangalore (36), in the Bangalore District; and Kolar (29), Malur (27), Sidlaghatta (26) and Chintamani (21) in the Kolar District. No data are available as regards the prevalence of the infirmity in taluks at the Censuses of 1881, 1891 and 1901, and the figures by taluks of 1871 do not stand comparison with the present figures for the reason, *inter alia*, that the boundaries of taluks have undergone great changes since then. An examination of the slips and compilation registers shows the disease to be rife in the country between the upper waters of the Southern Pennar and the Palar, chiefly in the tracts mentioned in the margin.

Taluk	Hobli (Revenue Circle)
Bangalore Taluk ...	Vartur, Yeswantapur, Uttarahalli, Bechar, Hesarahatta.
Hoskote Taluk ...	Bidarahalli, Siddale, Jagdishahalli.
Devanhalli Taluk ...	Valahalli, Chintamani, Jala.
Malur Taluk ...	Valahalli, Yeswantapur, Hesarahatta.
Chintamani Taluk ...	Nagavalli, Lakshmi.
Sidlaghatta Taluk ...	Kannur, Andhra, Loka.

CHAPTER XI.

CASTE.

216. Religion and caste are so intertwined in the economy of the social organisation in India that it is difficult to say with respect to any division of the Hindu community, where religious ordinance ends and caste control begins. Therefore, in order to comprehend, the "population and breed of men" of India, it is essential to understand the caste system of the Hindus and to gain thus an insight into the working beliefs, practices and observances, social and religious, of the millions of people comprised under the common designation 'Hindu.' Considered in this light, the present chapter is but a complement of the chapter on Religion (Chapter IV), and the one will have to be read with the other to get a clear idea of the matter dealt with in either. An attempt will be made in this chapter to study the caste system as it is found in the State, a study, which, it is frankly confessed, considering the vastness and the importance of the subject and the occasion of a report such as this is, must necessarily be cursory and subject to the qualifications insisted on by M. Senart that no statement that can be made on the subject of caste can be considered as absolutely true and that the apparent relations of facts admit of numerous shades of distinction.

Preliminary remarks and the accuracy of the caste return.

The first step to be taken is to have a correct appreciation of the statistics of caste as contained in Imperial Table XIII, of what it contains and of what it does not contain. One of the most difficult tasks in a Census is to obtain a correct enumeration of the entries of the 'Caste' column and thereafter to compile the information thus collected. The magnitude of the task must be the apology for any shortcomings in the list of castes, etc., as published in the table. Column 7 of the schedule was in the present Census divided into two sub-columns, so that the caste and sub-caste entries might be recorded separately. The instructions regarding the 'Caste' sub-column were:— 'Enter the main caste of Hindus and Jains; and the main race or tribe of others.' Regarding the sub-column of 'Sub-caste,' they were:— 'Enter the sub-division of the caste or tribe, if any such be returned.' The question that was to be put to the householder regarding caste entries ran thus: '(In the case of Hindus and Jains) mention the name of the caste and the sub-caste by which you are commonly known. (For other than Hindus and Jains) mention the name of the tribe or race to which you belong.' As a guide to the enumerator the names of the castes and chief sub-castes of castes returned in the Census of 1901, were printed below the specimen schedule on the cover, with the injunction that 'if any new castes are now returned, they should be entered.' In regard to this matter, representations were made (1) that in the case of some castes information regarding the sect, caste and sub-caste, could not be adequately conveyed through the columns as prescribed and (2) that, regarding the names of castes and sub-castes as made known to the Census staff, certain caste names and sub-caste names were inaccurate and the list not complete; and therefore instructions might be issued for the return of specified castes in the manner pointed out in each case. The reply given was to the effect that it was not the object of the Census to go into the merits or superiority *inter se* of castes; that the list given on the cover of the Census schedule was not exhaustive; and that if individuals really and truly thought, in the light of the obligation that rested on them in virtue of the Census Regulation, the caste name to be the particular one urged in the representation, they were welcome to return the same. The result seems to be that the caste return is mainly the return of the people according to their own description, modified by the exigencies of grouping together for purposes of comparison with the caste names of the previous Censuses.

Part I consists of a general discussion of the subject; Part II deals with the distribution of castes; and in Part III is given an ethnographic glossary of castes, etc., occurring in Imperial Table XIII.

evolution of caste (*e.g.*, Agasa, Kumbara, Kuruba); (c) the *sectarian type*, which comprises a small number of castes which commenced life as religious sects, but which reverted to the normal type of Hindu society, *i.e.*, caste, (*e.g.*, Lingayats, etc.), (d) *Castes formed by crossing*; (e) *Castes of the national type* (*e.g.*, Mahrattas and the Newars of Nepal); (f) *Castes formed by migration* (*e.g.*, Nambndri Brahmans of Malabar); and (g) *Castes formed by changes of custom* (*e.g.*, Pandaram in Madras). (5) Both tribes and castes are sub-divided into endogamous (marrying in the division), exogamous (marrying out of the division) and hypergamous (marrying above the division) groups. (6) Of the exogamous groups, a large number are totemistic. The same writer defines caste as "a collection of families or groups of families bearing a common name; claiming common descent from a mythical ancestor, human or divine; professing to follow the same hereditary calling and regarded by those who are competent to give an opinion as forming a single homogeneous community. The name generally denotes or is associated with a special occupation. A caste is almost invariably endogamous in the sense that a member of the large circle denoted by the common name may not marry outside that circle, but within the circle there are usually a number of smaller circles each of which is also endogamous" (Page 67.)

219. On a perusal of this very brief outline of the origin and development of caste, especially the portion dealing with the types of caste, we get an idea of the phenomena by which, collections of families became transformed from tribes into castes. But one is tempted to exclaim, "Why should the Aryan tribe in India alone develop into caste and not, as in Europe, lose its individuality by becoming merged in nationality?" The physical seclusion of India alone cannot furnish the answer; for it is said that when tribes are left to themselves, they exhibit no inborn tendency to crystallise into castes. This extremely fascinating subject has engaged the attention of scholars for a long time and has been "an insoluble problem." We do not think that any useful purpose would be served by attempting a solution in this Report and therefore we shall proceed to notice some features of the caste system as it exists in the State.

Some features of the caste system in the Mysore State.

(a) In compiling Imperial Table XIII (Caste, Tribe, Race or Nationality) for the State, it has been found necessary to *group together endogamous groups* wherever, for purposes of comparison with the figures of the preceding censuses, such a procedure was required. Endogamous divisions even though based on linguistic or provincial (*e.g.*, Agasa, Sakala, Vannan), territorial or local (*e.g.*, Vakkaliga, Kapu, Reddi), considerations have not been kept distinct. For instance, there would have been no meaning had all the entries of sects returned by Christians not been grouped under a few broad heads in Imperial Table XVII; the wood could not have been seen for the trees.

(b) Going over the list of the names of the castes, etc., (Hindu, Jain and Animist of the Table) we find *tribes of only one type, viz.*, the Dravidian type (Iruliga, Soliga, Paniya, etc.) and castes of all the types mentioned by Risley.

(c) The crucial test of a caste, *the existence of endogamy and exogamy* is found in each of the organisations.

(d) Ideas of pollution by touch or proximity of other castes, of performing *Sradhas*, of early marriage of girls before maturity, of taking the *mantra* from a Gurn, of prohibition of widow marriage are prevalent or non-existent according as the caste is found to have come under or kept away from *the influence of the Brahmans*.

(e) '*Hypergamy*' in the sense that a woman of a particular group in the caste is not at liberty to marry a man of group lower than her own in social standing does not prevail to any extent in the castes of the State. Of course, the natural desire of every parent to see his daughter married to a young man of an affluent house of good standing is as inherent in every caste as the desire to see the son marry a bride from a richer family and start life well.

(f) There are three well-marked *sectarian influences* visible in the constitution of the castes, which in some instances, were not able to produce a fission in the caste concerned. These are in historical sequence, (1) of the Jains, (2) of the Vaishnavas (followers of Ramanujacharya), and (3) of the Lingayats. Of these, the first seems to have had its day centuries ago and given way to the

other two which are in operation, serving to minister to the religious and ceremonial cravings of the members of castes, to whom the orthodox Brahman priest has not been accessible from time immemorial.

(g) The rules about *eating at the hands of other castes* slightly differ here from those of Northern India. For example, here Brahmans do not take water or articles of food baked, boiled or fried in ghee, from persons of other castes. But the amenities of civilized life are satisfied by each caste taking food prepared by persons of certain specified castes, most castes taking food prepared in the houses of Brahmans or Lingayats. Generally all the endogamous divisions, except such as are based on linguistic or territorial distinctions, of a caste observe commensality.

(h) The tendency to *consecrate men and women to God's service* (as Dasas and Basavis) is prevalent in certain castes.

(i) The practice of *adopting a son-in-law* into the household whether there is a son or not prevails in some castes (e.g., Beda, Besta, Golla, Morasu Vakkaliga, Vodka) and the practice of recognising the issue as legitimate, of the daughter of a sonless house, left on purpose unmarried, is found in a few castes (e.g., Beda, Holeyas, Madiga).

(j) *Polyandry* and the levirate are unknown.

(k) The custom by which a person can *claim his maternal uncle's daughter in marriage* and is often accepted, is observed in many castes.

(l) The traditional division of the trader, artisan and cultivator castes into two grand divisions, *18 phanas and 9 phanas*, is peculiar to Southern India.

(m) There are no sections of the *Brahmans* in Mysore who are held to be *degraded* on account of their ministering to the low castes as priests (e.g., the Barna Brahmans of Northern India). Some Brahman functionaries connected with great public shrines and some who accept forbidden gifts during the obsequies after cremation are not allowed to take food with other Brahmans.

(n) The castes at the lowest strata of society are the Holeyas and the Madigas. Unlike the purely forest and hill tribes, they do not fight shy of the settled life among other castes. We cannot surmise that the castes are simply primitive tribes come into contact with the Hindu civilisation, for two important reasons, *viz.*, (1) there are other primitive tribes within the reach of Hindu civilisation and so there seems to be no particular reason why Holeyas and Madigas alone should have merited particular attention at the hands of the Hindus; and (2) each of these two castes numbers more than 300,000 and the very numbers point to the voluntary entrance of the castes into the fold of Hindu civilisation. The lot of Holeyas was of old more or less that of agrestic serfs and that of Madigas, almost akin to that of unpaid general labourers. All these circumstances together with the existence of such sub-caste names among Kannada speaking Holeyas as Gangadikara and Morasu, seem to warrant the inference that these castes—*Holeyas and Madigas*—were the earliest settlers.

(o) The custom of observing the *Mahalaya* (new-moon day) in memory of deceased ancestors, prevails also in castes among whom annual *sradhas* are not performed.

on caste rules and restrictions but it is necessary to properly gauge the nature of effects without undervaluing or overrating the same. The movement, though very gradual, of society from status to contract; the minute specialisation of labour characteristic of modern times, necessitating closer interdependence of all sections of society; the sense of individualism (as contrasted with the communism of the joint family) which is permeating all classes with the spread of education; the equal opportunities in life now made available to persons of all castes whatsoever since the establishment of the Pax Britannica; those useful institutions in which no social distinction is known or can be possibly recognised, the railway train, the school or college and the dispensary;—the influences of all these emancipating tendencies have surely been borne upon caste restrictions; but for all that, it must be said, endogamy is endogamy and caste is caste. Rules regarding the adoption of a profession, the observance of pollution by touch or mere proximity of persons of other castes, restriction of competition by underselling (by members of the same caste) have fast been dying out, no one being anxious to enforce the same.

221. By the system of caste government is meant the manner in which the caste rules and restrictions regarding commensality, marriage, occupation and the like are enforced. As has been hinted above, the venue of occupation is almost deleted from the jurisdiction of caste tribunals. Questions of inheritance are settled (in cases where the aid of the Civil Courts is not invoked) by the village wise men including often the Shanbhog (Accountant) and the Patel (Head man) who are consulted along with, or independently of, the caste headman. Questions of food, of marriage, of the important domestic ceremonies, of admission of outsiders into the caste (where such a custom obtains) and of domestic or family dissensions come up before the caste council. Broadly speaking there are two kinds of such councils: (1) the religious authority has its agents scattered over the tracts where the castemen live; the agent is recognised on such ceremonial occasions as marriage; he makes his reports and transmits the decisions of the chief (*e.g.*, among Brahmans and Lingayats); (2) each caste in a village has its own chief who settles all matters of dispute as they arise, the chief headman being referred to only on important occasions (*e.g.*, Kurnba, Beda, Morasu Vakkaliga, Golla). This latter type prevails in the case of castes who are not yet impatient of caste control; and the authority exercised by such a headman goes far beyond the power wielded by the chief of the first type which has to be circumscribed by the considerations due to the delinquent's influential position in life or his inclination to test the efficiency of the fiat in a Court of Law. The succession to the headman's place is mainly hereditary, that to a 'muntt' being by nomination or ordination. The headmen of the castes who belong to the 'phianas' make use of the phana beadle also in convening assemblies in his jurisdiction or *kattemane*. The Ganda, Setti, Yajamana or headman is often assisted by his deputies (*e.g.*, Besta) or by assessors—*buddhiwantas*—in his work (*e.g.*, Vodda). The parties are summoned and heard, sometimes under oaths special to the caste (*e.g.*, swearing by a lump of *vibhuti* or sacred ashes after placing it on a *kumbli* and making *puja* to it, prevails among Kurubas; and swearing by *Junjappa* or sacred sheep is peculiar to Kadnollas). Then evidence is heard and sentence pronounced. The sentence usually consists of a fine.

222. As a working hypothesis we may assume that the group of families which first adopted the principle of endogamy (and exogamy) from the existing Indo-Aryan (or Hindu) system in its ranks, adopted the caste organisation and remained a self-sufficient social unit to begin with. Contemporaneous observers saw and picked out traits of uniformity in the beliefs, practices, origin and manners of similar endogamic groups and gave the groups a distinctive name which has come down to posterity as the caste name of the groups concerned and treated the endogamic groups as so many sub-castes with as many different names. Such a distinctive name very often denotes the traditional occupation of the caste and is nothing more or less than a functional name (*e.g.*, Baniya, Vakkaliga). Thus from the point of view of development, the sub-caste is the earlier unit. Of course, it may so happen in a few cases that a caste may not have more than one endogamic group in it, in which case, the caste name and the sub-caste name are identical, or the original sub-caste may have split up into two or more endogamous groups owing to residence in different parts of the country, etc. It is very common to

System of caste government.

Function of caste and sub-caste.

find the members of a caste (and its sub-caste) referring to themselves by the sub-caste names, the caste name being almost never mentioned: the caste name is usually the one referred to by persons of other castes while speaking of the members of the caste. There are also instances of castes existing in different parts of India, of corresponding social status and similar traditional occupation and with similar names (*e.g.*, Goalas of Bengal and Gollas of Mysore). The similarity of the function does not do away with the need of distinguishing the castes concerned, as they are so different in origin and development. In these circumstances, it is but reasonable to preserve in ethnographic literature the caste names as well as the sub-caste names. Discarding the caste name would be to miss the points of resemblance, ethnic, eponymous, functional or otherwise, that have been observed for years (almost centuries) by neighbours, themselves in many cases accustomed to live under similar social organisation, among the several endogamic groups comprising the caste: and overlooking the sub-caste name would mean not to recognise the members of the caste as they recognise themselves.

To demonstrate the value of these remarks, the constitution of a few sub-castes of certain castes (Agasa, Beda, Holey, Kuruba, Madiga, Nayinda, Vakkaliga, Vodda) are examined with reference to their origin, rigidity of rules of endogamy and commensality, caste councils and penalties on breach of the rules which differentiate different sub-castes of the same caste.

(a) *Origin*:—*Agasa*.—The main endogamous divisions, *Kannada* and *Telugu*, are based on the languages they speak. Two endogamous divisions of the Telugu section *Murikinati* and *Pasupapati*, are indicative of the country of origin.

Beda.—The endogamic divisions of *Uru*, *Gudlu* and *Mouda* are due to their original habits. (*Uru*, dwellers in villages; *Gudlu*, living in temporary huts; and *Mouda*, begging); that of *Myasa* is probably owing to the peculiar customs which they observe, *e.g.*, circumcision, abstaining from eating fowls and pigs.

Holey.—There are divisions comprising endogamous groups based on the language they speak, Kanarese, Telugu and Tamil. Of the Kanarese-speaking division, the groups of *Gangadikara* and *Morasu* probably point to the Vakkaligas of those names under whom the sub-castes took refuge when they were first dispossessed of the lordship of the soil; the groups *Dasa* (servant), *Hagga* (rope) and *Magga* (weaver) had their origin in the different occupations followed.

Kuruba.—There are three chief endogamous divisions: (1) *Halu* (milk) or *Sada* (pure), as they abstain from liquor; (2) *Ande*, because they used to catch the milk of their sheep in a bamboo cylinder or *ande*; (3) *Kambali* (blanket), as they weave coarse blankets and their women dress themselves with aprons of the same material.

Madiga.—The two main divisions are based on the language they speak, Kanarese and Telugu. Each language division has three endogamous groups which are named after the manner in which the bride and bridegroom eat the common marital meal or *Burra* in a *Tanige* (dish), a *Hedige* (basket) or a *Mora* (winnow).

Some sub-caste names among Brahmans point to the original homes of the people named; and some sub-caste names among Lingayats point to the occupation or caste from which these were converted.

(b) *Rigidity of the rules of endogamy and commensality*.—*Agasa*.—The groups of endogamous divisions do not eat together or intermarry.

Beda.—Intermarriage is not allowed; commensality probably is in vogue.

Holeyas.—Tamil Holeyas take food in the houses of Kannada and Telugu sections, while the latter do not return the compliment, regarding the Tamil Holeyas as inferior in origin. The Gangadikar Holeyas, however, do not eat in the houses of even other Kannada Holeyas. Endogamy is strictly observed.

Kuruba.—The divisions are strictly endogamous. Male members may dine together.

Madiga.—The Kannada Madigas do not intermarry with the Telugu-speaking Madigas.

Naginda.—Endogamy is strictly observed.

Pakkaliga.—Endogamy is strictly observed. Commensality is in vogue.

Vodda.—By changing the occupation to a stone worker, a Mannu-Vodda may marry a girl of the Kallu-Vodda section. These two sections do not eat with Uppu-Voddas, who are sweepers in towns. Kallu-Voddas are acknowledged to be superior to other classes and do not eat with them.

(c) *Caste Councils*.—Sufficient information is not available as to whether sub-caste councils are affiliated to a common caste council. The jurisdiction seems to be territorial over the caste or connected group of endogamous groups, rather than over the endogamous group only. The Morasu Vakkaligas, for instance, are divided into *Kattamanas*, each of them being presided over by a *Yajaman* or *Gauda*. Several *Kattamanas* form a *Nadu* (division of country) and at the head of each *Nadu* is a *Nadu Gauda*. Several such *Nadus* form a *Desa* (or country) presided over by a *Desayi Gauda* or *Bhumi Gauda*. There are two such, one at the head of the Telugu section and another at the head of the Kannada section of this caste. The goldsmiths are recognised by the other Panchalas as the head of their clan and are given caste jurisdiction.

(d) *Nature of penalties on breach of rules which differentiate the sub-castes of the caste*.—Breach of rule of endogamy is severely punished. As regards offences against rules of food, the caste *panchayats* are disposed to be lenient.

223. The question of the extent to which caste prejudices and restrictions have survived amongst or extended to, the Muhammadans, is one on which there is little to be said. Social prejudices and restrictions such as are noticeable in all nationalities do exist among Muhammadans also; but the social prejudices and restrictions that are peculiar to the Hindu institution of caste may be said to be non-existent. Some tribes (*e.g.*, Dayare, Navayat, Pinjari and probably Meman) do not marry out of the tribe. Caste among Muhammadans.

224. A short account is here given of the description of the characteristics of castes as they are found in proverbs and popular sayings (chiefly of the Kanarese language). A proverb has been described 'as the wisdom of many and the wit of one' and again 'a proverb is to speech what salt is to food.' Without attaching undue importance to proverbs which are sometimes half truths and caricatures, we may say that a study of them gives us an insight into the thoughts and feelings of the people and that the study of sayings relating to caste shows us how people describe themselves. Caste in proverbs.

Proverbs may be grouped as (i) general, where a caste name is taken to illustrate a common characteristic; or as (ii) particular, where the characteristics of the caste are held out to view.

(i) The meaning of 'To ride a willing horse to death' is expressed in 'If an elephant is tame, the Agasa has a clothes load ready to put on its back.' 'Every man to his trade' has its parallel in the following: 'A Brahman unaccustomed, singed his beard and whiskers in making a *homa*'; 'A carpenter planes and a bricklayer builds'; 'An Agasa's prowess can be shown on the clothes of others'; and 'Like searching for a brass pot in a potter's kiln.' That the example of men is catching is funnily expressed in 'Jogi and Jogi jostle and the pots (slung on their shoulders) rattle.' 'All that glitters is not gold' finds parallels in 'If the

dhotra (cloth) is gandy, is he of a big *gotra*?' and 'Never trust a black Brahman or a white Holeyā.' Worldly wisdom is expressed in the saying 'A Konkani's buffalo and a stout club.' Imprudence and want of sense of proportion are censured in 'The setti's toilet went merrily on while the town was taken,' and 'The enemy is at the gate (of the village): Oh! Help me to don my dress' said the Ganda's grandam.' The difficulty of original work is referred to in 'It takes a year for Kumbara (potter) but a minute for a stick.'

(ii) The description of castes is not always to the credit of the caste concerned. Still, 'To see ourselves as others see us' is an advantage. Taking the castes that ordinarily constitute a village, we find the description running on, somewhat as follows: the Brahman's helplessness is remarked in 'The coward said 'I cannot fight an elephant or a horse or a soldier; what shall I do?' 'Go,' said his friend, 'and fight a bald Brahman''; and 'On mounting a jaded horse that all had ridden, the astrologer slipped and fell down.' 'Never stand before a Brahman or behind a horse' refers to his tendency to beg and trouble one. 'Never be a Brahman's servant or Ganiga's bull' refers to the habit of dining late, after performing ceremonies (and the consequential late feeding of the servant) usual among Brahmans. The usual item of expenditure is pointed out in 'The Brahman earns for *sraddhas*, the Holeyā for drink and the Vakkaliga for the fine.' One sees a cynicism worthy of Dean Swift in 'A Brahman's presence destroys a village as that of a crab does a tank.' An equally cynical proverb exists regarding a Baliya (Telugu trader): 'A Baliya as small as a garlic tuber, and the village is ruined.' The Shanbhog, the principal village functionary, is twitted in 'Forget where you find the Shanbhog's buffalo as soon as you see it'; 'A Shanbhog when hungry looks to his old accounts'; 'There may be levied one hundred (pagodas) from the village; but never a cash from the Shanbhog'; and 'Never ask a Shanbhog if he had his dues and never enquire if your wife's relatives have dined.' 'Agriculture not done by a *Vakkaliga* is no agriculture,' but 'He pawns jewels for a feast'; 'He is generally friendless.' The trader's businesslike habits are referred to in the following: 'The town is where the setti builds'; 'The setti never enters a flood unless there be a profit for the trouble'; 'The Komati may fall but he will never fail in his accounts'; 'He will not be deceived but if unfortunately he is, he will never tell'; 'A setti's affairs will come out only after his death'; and 'You can stand a Brahman's anger but never a setti's smile.' The artisans come in for their share of these wordy squibs thrown at them. 'A goldsmith knows whose ornaments are made of gold just as an Agasa knows the poor (as is evident by their not having changes of clothes) of the village.' 'The Akkasale (goldsmith) cannot help taking from the gold given to him to work by his sisters or brothers'; 'An Agasa's courtyard is dirty and so is a barber's house'; 'One can dine out of an Agasa's hand but never in a barber's courtyard'; 'The washerman is bedecked with his master's finery.' A Ganiga's (oilman's) bull is as lean as the church mouse and hence the adage, 'Never take a bull from a Ganiga.' 'The weaver was ruined by separating from his partner (and the chetty by having one).' The mendicant classes are naively described. 'Jogi and Jogi clasp and both are smeared with ashes'; 'A Jogi's knapsack is on his shoulder the moment he gets up'; 'The house is on fire but the Jangama's bag and bowl are with him'; 'A king is satisfied with half a kingdom (his neighbour's) but the beggar wants a full one.' Temple servants are referred to in the following: 'Infants and temple servants do not suffer from hunger'; 'Never (take in marriage) a *pujari's* daughter (for she is accustomed to the toothsome dainties offered to the god worshipped by her father and so off and on keeps going to the parental home).' The habits of Holeyās are thus described: 'Never engage in agriculture depending on the word of a Holeyā'; 'Though seventy years old, he will not work unless he is prompted.' The future of a Madiga seems preordained, if we are to believe the saying, 'No truth in Vedas and no Madiga in heaven.'

PART II.—STATISTICS.

Statistics
of castes

225 Imperial Table XIII comprises the statements relating to the division of the population into caste, tribe, race or nationality. Apart from this general

table, there are other tables specially devoted to bring out certain attributes by caste, *i.e.*, Imperial Table IX deals with literacy; Imperial Table XII-A gives figures for infirms; Imperial Table XIV exhibits figures for civil condition; and in Imperial Table XVI are found the statistics of occupation. In Imperial Table XV-E—Statistics of Industries—information as to the castes, etc., of owners and workmen is given. It may be noted here that the Imperial Tables IX, XII-A, XIV and XVI were compiled for all castes, tribes and races in the State. The characteristics of these tables are dwelt upon in the special chapters allotted to them. In this chapter, it is only the general distribution of the population into caste, tribe, race or nationality that is discussed.

The Subsidiary Tables appended to this chapter are:—

(i) I. giving a statement of castes classified according to their traditional occupations;

(ii) II. showing variation in caste, tribe, etc., returning not less than two per mille of population since 1871. It may be added that no special statistics were collected with regard to castes as in 1901, when the special caste Tables related to (1) Gotras, Sakhas and Sects of Brahmans; (2) the Gotras of non-Brahmans and (3) Phanas.

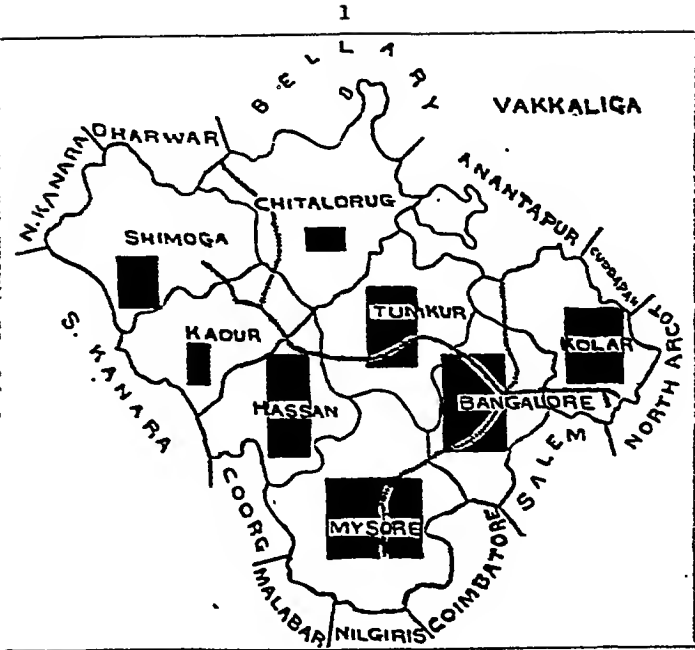

226. The local distribution by districts (including cities) of the following **Maps.** castes, Vakkaliga, Lingayat, Holeyā, Kurnba, Madiga, Brahman, has been illustrated by means of rectangles in the appended inset maps; the base of the rectangle indicating the population of the district, the height, the proportion that the caste bears to the district population, and the rectangle consequently indicating the strength of the caste in the district.

227. (a) *Hindu*.—There is only one caste, *i.e.*, Vakkaliga, numbering over 1,000,000. The numbers (1,331,029) represent 24·9 per cent of the Hindu population of the State. There are two castes Lingayat (729,431), Holeyā (613,248), of over 500,000 and under 1,000,000 forming 25·1 per cent; the castes, 10 in number, Banajiga (132,955), Beda (268,454), Besta (156,863), Brahman (194,570), Golla (150,842), Kurnba (403,366), Madiga (308,083), Panchala (128,098), Uppara (108,131) and Vodka (142,482) aggregating between 100,000, and 500,000 come up to 37·3 per cent; three castes between 50,000 and 100,000, Agasa, (97,772), Neygi (96,466), Tigala (69,233) form 4·9 per cent. The remaining castes below 50,000, 57 in number total up to 409,885* and comprise the remaining 7·7 per cent of the total Hindu population. **Groups of castes and tribes according to the numbers returned.**

(b) *Musalman*.—The only tribe returning over 100,000 is that of Sheikh (176,482) forming 56·1 per cent of the total number of Muhammadans in the State. There are two tribes between 10,000 and 100,000, Pathan (44,689) and Saiyid (57,671) which comprise 32·5 per cent; the Mughal (8,151) is the only tribe between 8,000 and 10,000 making up 2·6 per cent; the remaining 24 tribes return 27,501* and form 8·7 per cent of the total Musalman population.

228. The appended inset maps and rectangles inserted in them are designed to show the local distribution of a few numerically important Hindu castes. The following statement gives, as regards Hindu castes of over 100,000, percentages of the caste population to the total population of the State and of each district. **Distribution of castes by districts.**

* NOTE.—The numbers under 'unclassified and unspecified' are reckoned, however, for the sake of the total.

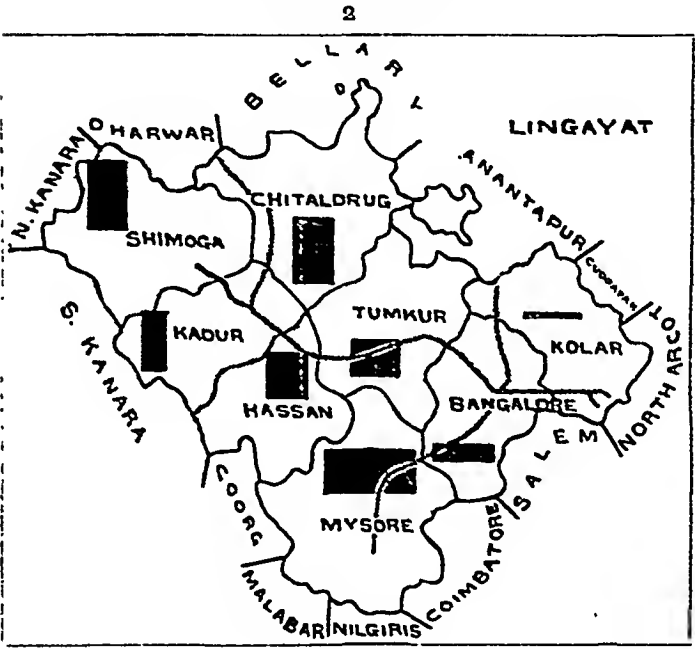

REFERENCE.

The base of each rectangle indicates the population of the district.

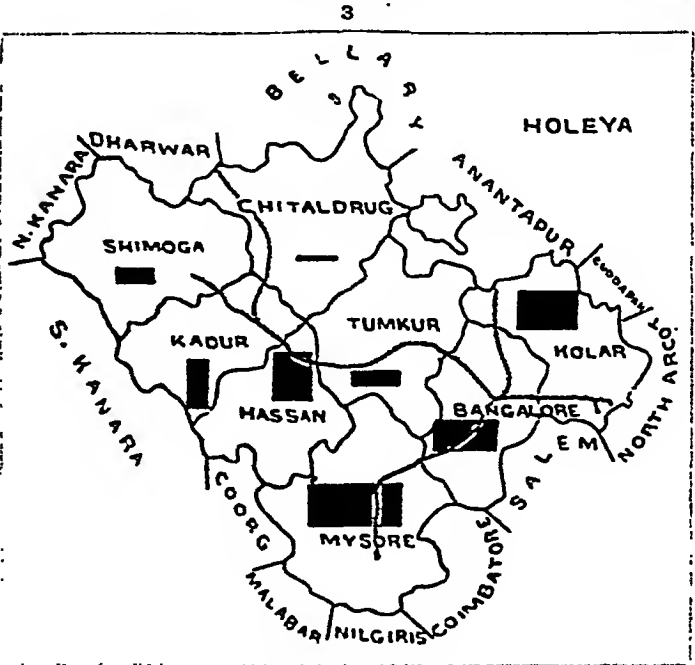

Scale 1" = 2,700,000 persons.

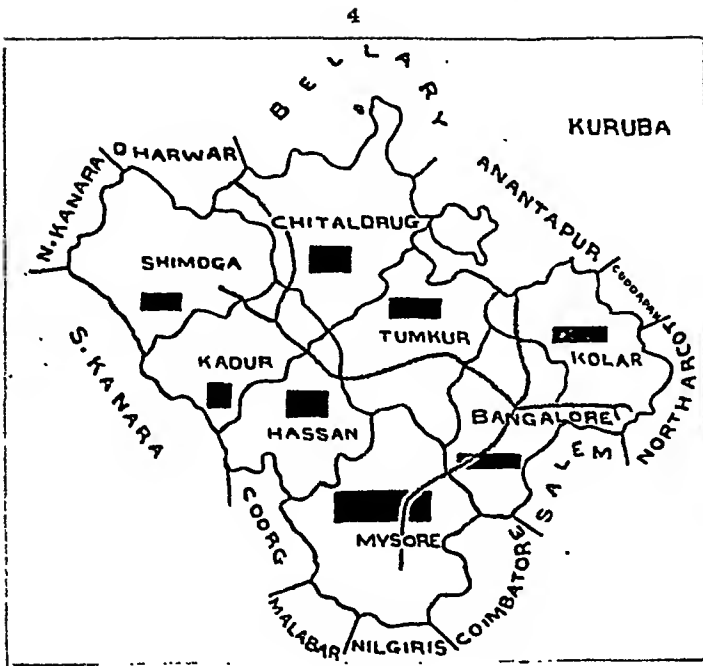

The height shows the proportion which the caste bears to the population of the district.

Scale 1" = 60 per cent.

∴ The area of the rectangle shows the strength of the caste in each district.

Uppara ...	13	10	Jogi ...	26	24

Variation since 1901.

229. It has been found that the variation in the numbers of Hindus in the State since 1901 has been +4·7 per cent. (Chapter IV, Subsidiary Table I.) Noticeable increases are found in the case of Kshattriya (+49·1), and Mudali (+52·2); and marked decreases are evident in the case of Idiga (−19·6), Kumbara (−4·0) and Mahratta (−14·0).

- Kshattriya*.—Comparison by districts shows that there have been notable increases in Chitaldrug, Bangalore and Kolar (including the cities situated therein) districts. The original functional name may have been freely returned.
- Mudali*.—The increase is due to the figures of the Civil and Military Station, Bangalore, for 1911 exceeding those for 1901 by nearly 6,000.
- Idiga*.—This caste has shown a marked decrease in the Western Division.
- Kumbara*.—The decrease is general in the Western Division and the Chitaldrug District.

- (e) *Mahratta*.—The decrease is noticeable in the Mysore, Chitaldrug and Kolar Districts; the reason in the case of the first two districts being due to the closure during the decade of the large public works on the New Palace and the Marikanve lake respectively.

230. The percentage of net variation since 1871 in the case of Hindus has been +13·2 exclusive of 89,049, persons shown as wild and wandering tribes under Hindus in 1871. Marked increases above this standard are found in Lingayats (+74·5) and Mudali (+99·2) and notable decreases in Idiga (−52·0), Kshattriya (−31·1), Nayinda (−0·6), Neygi (+1·0) and Vakkaliga (+1·6). Variation since 1871.

- (a) *Lingayat and Vakkaliga*.—At first sight it is very astonishing to find that these two castes, which are found distributed throughout the State, should vary so widely in the percentage of increase during 1871-1911, one of them, Vakkaliga, showing an increase of only 1·6 while the other, Lingayat, shows an increase of 74·5. The reason for the apparent difference is to be traced to the inclusion, in the Censuses of 1871, 1881 and 1891, under Vakkaliga, of Nonabas and Sadas who are Lingayat cultivators. (*Vide* also the remarks contained in pages 495-6, Mysore Census Report of 1901.) A glance at column 10 of Subsidiary Table II of this chapter shows that 'Lingayat' is the single caste numbering more than 100,000, that is shown to have had an increase and that too a good one of +12·5 per cent, in the decade 1871-81, during which occurred the terrible Southern Indian famine of 1876-7. Now agriculturists are the first (next after the labouring classes) to suffer from famine. As in the computation in 1881, Nonabas and Sadas were placed under Vakkaligas (*vide* page 66, Mysore Census Report of 1881), the vast decreases that must have occurred in the ranks of these people, were not included in the figures under 'Lingayat'; hence the real decrease has not been shown against the caste in the decade 1871-1881. Trying to reconstruct the figures of the two castes for 1891, 1881 and 1871, by including Nonabas and Sadas under 'Lingayat' (by means of actual figures of 1881 and 1891, and estimates of the numbers of Nonabas only of 1871) and placing these side by side with those for 1901 and 1911, we have the following result:—

Caste	Persons (000's omitted) in					Percentage of variation increase (+), decrease (-)				Percentage of net variation 1871-1911
	1911	1901	1891	1881	1871	1901- 1911	1891- 1901	1881- 1891	1871- 1881	
<i>Lingayat.</i>										
(a) Figures as in Sub- sidiary Table II.	730	671	483+64 (Nonabas) (105) (Sadas)	470+35 (Nonabas) +96 (Sadas)	418+70 estimated (Nonabas) +119 (Sadas) 607	+8.7	+38.9	+2.7	+12.5	+74.5
(b) as reconstructed ...	730	671	652	601		+8.7	+2.9	+8.5	-1.0	+20.3
<i>Vakkaliga.</i>										
(a) Figures as in Sub- sidiary Table II.	1,331	1,287	1,342 -169	1,060 -131	1,310 -189	+8.4	-4.0	+26.6	-19.1	+1.6
(b) as reconstructed ...	1,331	1,287	1,173	929	1,121	+8.4	+9.7	+26.3	-17.1	+18.7

- (b) The increase in 'Mudali' is chiefly due to the increase of nearly 6,000 returned as such in the Civil and Military Station, Bangalore, in the decade 1901-11.
- (c) As regards 'Idiga,' the class 'Halepaika' which is numerous in the Western Division was included under 'Idiga' in the Census of 1871 (*vide* page 66, Mysore Census Report, 1871) but has since then been included under 'Vakkaliga' to which it properly belongs. In 1881, 'Halepaika' was shown separately (*vide* pp. 65, 67, Mysore Census Report, 1881, and Tables) and in the subsequent Censuses has been omitted under 'Idiga' (*vide* p. 256 of Imperial Tables

the numbers of these having been included under Aninist in the foregoing statement:—

(1) KADUR DISTRICT.

Caste	Numbers in		Difference	Percentage of variation
	1911	1901		
Agasa	4,337	4,614	-277	-6'0
Banajiga	7,524	8,256	-732	-8'9

Vodda	17,768	16,339	+1,429	+8'7

PART III.—ETHNOGRAPHIC GLOSSARY.

**Ethno-
graphic
glossary.**

232. An ethnographic glossary containing a brief note on the traditional occupations, customs, etc., of the various castes, tribes or races, will be a fitting conclusion to this chapter. It should be remembered that the glossary is intended merely to serve as an introduction to the fuller study of the subject in standard books like the volumes of Ethnographic Survey in Mysore or Thurston's Castes and Tribes in Southern India. The names of castes, etc. (printed in the glossary in clarendon type) are those the distribution of which is given by Districts in Imperial Table XIII. The figures entered after them show the total strength of the caste. Among Musalmans, Jains, and Animists, are found returned the names of some castes which find a place among Hindus also. In such cases, the numbers of such entries are brought together under the name where it first occurs, with a letter to indicate the religion returned (*e.g.*, H-Hindu; M-Musalmán; J-Jain; A-Animist). The books referred to are the Mysore Census Reports of the several Censuses (C. R. 1871, *etc.*), the Monographs of the Ethnographic Survey in Mysore (Mys. Eth. Mon.), Bhattacharya's Hindu Castes and Sects (B. H. C.) and Thurston's Castes and Tribes of Southern India (C. T. S. I.).

GLOSSARY.

HINDU.

Agasa (97,772).—A caste of Kanarese washermen. Out of 30,141 actual workers, 13,948 follow the traditional occupation. The other chief occupation of the caste is agriculture. The caste has two main endogamous divisions based upon the language they speak, Kannada Agasas and Telugu Agasas. (It should be noted that the Mahratta and Hindustani-speaking washermen have nothing to do with the Agasa, but are immigrants of a recent date.) These main divisions do not intermarry or dine together. Among the Telugu sections, there seem to be other endogamous subdivisions. Polygamy is not prohibited but is rarely practised. Both infant and adult marriages are allowed and practised. A girl may even remain without marriage all her lifetime. The bridegroom or his party has to pay a price for the bride, the amount varying in different localities, between Rs. 12 and 24. Widow marriage is allowed and practised; but the husband must always be a widower. Adultery or loss of caste enables the husband to divorce the wife; for loss of caste only can the wife break the marriage tie with the husband. They do not perform *sraddhas*. The Agasas are found all over the State. They form part of the village corporation.

In most cases, their priests are *Jangamas* or their own headmen; but a few are in the habit of calling in Brahmans as *purohits*. Their *guru* is a Lingayat to whom they give periodical presents. They are employed as torch-bearers on festive occasions and to show respect or light the way to persons of rank. They are also worshippers at some of the shrines of the humble order. They do not wash the clothes of Holeyas and Madigas. Agasas are Saivites and Vaishnavites also. They, however, show reverence at all recognised shrines. Their goddess is Lakshmidēvi, the consort of Vishnu. Their trihal god is 'Bhūmidēvaru' (Earth God) which they worship during the Gauri feast (August-September), after which they perform *Ubhe-puja* (worship of the washing tub). They belong to the 18-Phanas section. They have a ceremony for taking into their caste persons from higher castes such as Vakkuligas, Knrubas and others. After ascertaining that the original caste has no objection to one of their men being taken into their fold, they invite their own castemen from several divisions to a meeting at which all the Yajnmans of the several divisions and others are present. The candidate has to get shaved and bathe in a tank or river and worship Ganga (Water Goddess). After being given *tirtha*, he is made to pass successively through seven huts which are burnt soon after he leaves each. He bathes again and is given a paste of soap-nut and turmeric which he swallows. Then he makes *pūja* to the spoon and bell, the symbol of the 18-phanas, with which are placed some *vibhuti* balls. The *kolkar* applies some of the *vibhuti* ashes to his forehead. After this, there is a dinner at which the recruit eats along with others and is treated as one of the caste. (*Mys. Eth. Mon.*)

Bairagi (267).—An immigrant caste. The Bairagis are the followers of Ramanand. Most of them are mendicants, who pass through Mysore in the course of their itineration to places of pilgrimage in Southern India. They are also known as Sadhus. The Bairagis are not very strict about the caste rules and they will usually eat cooked food given to them by a clean Sudra of any caste. They are all Vaishnavites and worship *saligrama*. (C. R. 1901; B. H. C.)

Banajiga (132,955).—Kanarese tradesmen. Of the actual workers, 7,301 follow the traditional occupation, while 19,658 are agriculturists. The other principal occupation is labour. This caste is divided into numerous sects, the principal of which are Telugu, Dasa, Yale and Gopati Banajigas. The Telugu Banajigas originally came from Madras and Northern Circars. Many Banajigas are Lingayats also by faith. The Banajigas are divided into a number of sub-castes none of whom eat together or intermarry. One of the sub-castes called Balegara (makers of bangles), Devadigas or Bannagars does not indulge in either animal food or spirits. The Telugu Banajigas are either Saivites or Vaishnavites. They do not wear the sacred thread or follow the Vedic ritual. Widows are prohibited from remarrying and the dead are buried. The *guru* of the Vaishnavite Telugu Banajigas is the *guru* of the Sri Vaishnava Brahmans. These belong to the 18-phana section of the community of which they are the foremen (C. R. 1871, 1901).

Baniya (64).—These are immigrant traders and money-lenders from Northern India. The word Baniya is a corruption of the Sanskrit word '*banik*' which means 'merchant.' The subdivisions among the Baniyas are said to be as numerous as those amongst the Brahmans. (B. H. C.)

Bavaji (25).—'Bavaji' is very probably another form of 'Babaji' which is the usual title of male mendicants of the Vaishnavite sect founded in Bengal by Chaitanya. These are immigrants.

Beda (268,454).—The name Beda is a corruption of the Sanskrit word '*Vyadha*' meaning a hunter and shows what the original occupation of the caste was. This traditional occupation is not nowadays followed as principal occupation (only 50 actual workers being returned in this Census as doing so). The chief occupations followed are agriculture, village service (as watchmen), ordinary labour and service as peons in Government departments. The Bedas, from their hardy out-door life, were largely employed in the rank and file of the armies of the Vijayanagar Empire; later on Hyder Ali employed them extensively as soldiers. They seem to have been originally a Telugu-speaking people but after long settlement, those of the Kannada districts, have adopted that language as their mother-tongue. The following are the endogamous divisions of the caste:—Uru, Myasa, Gudlu, Maremma, Halu and Monda. Uru Bedas are by far the largest division of the caste, and are so called because of their residence in towns and villages, unlike for example, Monda Bedas, a

wandering tribe, who are beggars by profession. Myasa Bedas are found mostly in the Chitaldurg District. They form an interesting division and have some peculiar customs such as circumcision, and abstaining from eating fowls and pigs. They lived mostly in jungles till recently; many have since taken to living in towns and villages. It deserves to be ascertained how far their customs have been moulded by the influence of Musalmans. These seem to be the same as the forest tribe known as Chenchu who are a Telugu-speaking jungle tribe inhabiting the hills of the Kurnool and Nellore Districts. Gudlu Bedas live in temporary huts and form an inferior division. Monda Bedas never enter the houses of the other Bedas. They live by hegging. The caste is divided into a number of exogamous divisions and their integrity is kept up with the utmost scrupulousness. Polygamy is allowed. Marriage is generally of adults. A woman may remain without marriage all through her life. The bride's price is Rs. 12. Widow marriage is allowed and generally practised but the form differs considerably from the regular marriage and is styled union or 'kudike' or the giving of a cloth to wear or the tying of a 'tali.' Loss of caste and adultery are good grounds for divorce. The practice of making Basavis of women obtains in this caste. When there are no male children, the eldest daughter may be converted to a Basavi, when she remains permanently in her father's house, inherits the property and in all possible respects, takes the place of a son. A girl afflicted with a dangerous illness, is often made a Basavi in pursuance of a vow to the effect. The dedication of Basavi is made by a ceremony which as far as possible resembles a marriage. After the ceremony the girl is free to associate with any man who is not of a lower caste than her own. Her issue become legitimate and are entitled to a share of their grandfather's property. A widow or a divorced woman may become a public woman with the consent of the castemen, when she has the same license as a Basavi but her issue, though legitimate, rank only as the issue of a *kudike* marriage. No *sraddhas* are performed. Outsiders from any recognised higher castes are admitted to the Beda caste, the headmen and castemen being assembled for the ceremony. *Illatom* (*manavalatana* in Kannada) or affiliation of a son-in-law is practised and such son-in-law gets a share equal to that of a son. The Bedas belong to the 9-Phana section. They are Vaishnavites, but some are Saivites also. Their Guru is a Srivaishnava Brahman who pays occasional visits, gives them *chakrankitam* (hrandings) and holy water and receives his fees. The goddesses worshipped by Bedas are Gangamma, Maramma, Kavellamma, Lakkamma, Payamma, Odisilamma, Mariamma, Durgamma and Chellapuramma. Muniswara, who is said to be the soul of a saint who lived at a time beyond memory and to reside in trees, is worshipped by the Bedas in common with the other lower castes. (Mys. Eth. Mon.; C. T. S. I.)

Besta (156,863).—In the Eastern Districts, they are called Besta (fishermen); in the Southern, Toraya, Ambiga and Parivara (boatmen); while in the Western parts, their names are Xabyara and Gangemakkalu. Their main occupations have been fishing, lime-burning, palanquin-carrying and cultivation. Of late, fishing as an occupation is deprecated. Most of the actual workers are cultivators and labourers, a small number only being returned as fishermen and traders. The Bestas belong to the 18-phanas and do not dine with any of the 9-Phanas who are their rivals. The following are the exogamous divisions or 'Kulas':—Chinna (gold), Belli (silver), Surya (sun), Chandra (moon), Devi (goddess), Suta (charioteer), Mugilu (cloud), Bhashinga (marriage chaplet), Muttu (pearl), Ratna (precious stone), Kasturi (musk), Havala (coral bead) and Mallige (jasmine). It is said that silver ornaments are not worn by those of the Belli Kula except during marriages. This caste admits persons of superior castes in the social scale, after a ceremony. A Besta girl may remain unmarried. The practice of dedicating Basavis, though it exists, is getting into disfavour. Both infant and adult marriages are allowed to take place. The brideprice is Rs. 12. Divorce is allowed on the ground of unchastity on the part of the wife. The remarriage of a widow is permitted if she and her husband pay to the caste a fine of Rs. 6 and 8 respectively. Polygamy is practised. A son-in-law remaining with his father-in-law is stated to be entitled to inherit the property of his father-in-law, provided he performs the latter's obsequies. Ceremonies for deceased individuals are not performed periodically. For the propitiation of the ancestors in general, a *yade* consisting of all the articles of food and plantain leaves and coin, is presented to a *purohit* on Mahalaya day. Religious mendicants such as Dasayyas are fed. Among the Bestas are both Saivas and Vaishnavas. There are two religious mendicant orders in this caste, the Saivite Jogis who worship Bairadevaru of Chunchangiri and the Vaishnavite Dasaris who worship Ranganatha of Biligiri Rangan hills. Tolasamma, Maramma, Uttanhaliyamma, Patalamma, Kalamma, and Yellamma are also worshipped. Pujaris of this caste worship daily in the temples built for these. (Mys. Eth. Mon.; C. R., 1901; C. T. S. I.)

Bhatraju (905).—These speak Telugu and are supposed to have come from the Northern Circars. Probably these were bards in the Court of Vijayanagar and as the empire split in the 16th century, they passed to the courts of minor chiefs and viceroys further south. Nowadays they are mostly mendicants. They employ Brahman priests for their marriages but Jangamas or Satanis for funerals. They are principally worshippers of Vishnu and correspond to the Bhats of Northern India. (C. R., 1901.)

Brahman (194,570).—The tenets and customs of the Brahmans are so well known that they need not be described here in detail. It is remarkable that the traditional occupation of priest is followed by a very small minority of actual workers. Income from rent of land, public administration and the learned professions are the chief occupations that support the majority. The Brahmans are divided into Pancha Gauda and Pancha Dravida sections, those living north and south of the Vindhya, respectively. The Pancha Gauda comprise Saraswata, Kanyakubja, Gauda, Utkala and Maithila classes; the Pancha Dravida consists of Maharashtra, Andhra, Dravida, Carnata, and Gujarati classes. The names of these classes originated from the tracts where they lived in centuries gone by. The Brahman population in any district is almost never of the same class. The divisions and sub-divisions of the several classes are so numerous that it is exceedingly difficult

different from these Dasaris are the Donga Dasaris of the Bellary District, who pretend that they are Dasaris, and thus mix with the villagers, in order to steal from them later on as opportunity offers. (C. R., 1901; C. T. S. I.)

Dogra (3).—The name is said to be derived from the Sanskrit words *Duan Garta* which mean 'two valleys.' These are immigrants in the Civil and Military Station, Bangalore.

Dombar (3,390).—These are found chiefly in the Tumkur and Kolar Districts. They are tumblers and acrobats by profession. Some follow agriculture also. The settled portion of the caste are found in Tumkur, Manchenahalli in Gorihidnur Taluk and Chiknayakanahalli Taluk and are almost all engaged in agricultural pursuits, the proceeds of which they supplement by comb-making and pig breeding. Their *guru* is a Sri Vaishnava Brahmin. The wandering section, owing to their nomadic life, is broken into a number of groups, each having its own Yajaman. The common head of this section is said to be a man of the *matli* sub-division and is styled *matli nayadu*. The Dombars are a Telugu caste, having migrated from the Kurnool and Nellore Districts, and have nothing to do with the Doms of Northern India. Polygamy is common. Girls are trained to play on poles and such as become skilled in that art are not married and lead a life of prostitution. The *tera* or bride-price, is as high as Rs. 52. The practice of dedicating Basavis is common specially with the wandering section of the caste. No *sraddhas* are performed. The chief deities worshipped are Yellamma, Sunkalamma, Gurumurti and Marumma. The Dombars freely admit recruits, both male and female, from any caste, not lower than their own, as fixed by the test of commensality. The wandering Dombars breed pigs on a large scale; men engage themselves as day labourers in the villages near or about which they encamp, their women going about hogging also. They are expert bird-catchers which they secure either by spreading snares or applying bird-lime on their roosts. The wandering section generally live in huts made of bent bamboos covered over with date mats, in the form and size of the tops of country carts; and they carry baggage from place to place on donkeys or oxen. (Mys. Eth. Mon.)

Ganiga (40,469).—The caste is chiefly found in the Mysore, Bangalore and Kolar Districts. The traditional occupation is oil-pressing. Nearly one-fourth of the number of actual workers follow it as their principal means of livelihood. Cultivation of land is the chief occupation. The Ganigas are known by different names according to locality and special customs such as Hegganigas, those who yoke pairs of oxen to their stone oil mills; Kiru-Ganigas those who work with wooden mills; Vontiyettu Ganigas who yoke only one bull to the mill, etc., none of whom eat together or intermarry. The main caste of the Ganigas is also known collectively as Jotiphana or Jotinagara, or the tribe of light. These belong to the 9-Phanas section of which they along with the Nagartas form the leading communities. The Ganigas are both Vaishnavites and Saivites. There is a small division of the oil-mongers who wear the *linga*, known as Sajjana. These Sajjanas hold no social intercourse of any kind with the other sub-divisions. The Saivite Ganigas own the Jangamas and Linga Banajigas as their *guru*. Widows are not permitted to marry. If a young man dies a bachelor, the corpse is married to an arka plant (*calotropis gigantea*), and decorated with a wreath made of the flowers thereof.

The oil mill of the Ganigas has been described thus:—

"The oil mill is a sort of large wooden mortar, usually formed out of the heart of a tamarind tree and firmly imbedded in the ground. A wooden cylinder, shod with iron, fits roughly into the cavity. A cross beam is lashed to this in such a way that one end is close to the ground and to this a pair of bullocks or buffaloes is fastened. By an arrangement of pulleys the pressure of the cylinder can be increased at pleasure. As the bullocks go round the trough, the seeds are crushed by the action of the cylinder, so that the expressed oil falls to the bottom, while the residuum as oil cake, adheres to the side of the mortar." (C. R., 1891, 1901; C. T. S. I.)

Garadiga (325).—These are found chiefly in the Kolar and Bangalore Districts. The traditional occupation is that of jugglers, snake charmers and animal exhibitors: in fact, begging is usually combined with the same. They are mendicants from the Telugu country who also practise sleight-of-hand tricks.

Golla (150,842).—These are found chiefly in Tumkur, Chitaldrug, and Kolar Districts. The main occupation is agriculture. Only a small number follow the traditional occupation of cow-herds. Many earn their livelihood as labourers. The caste consists of Uru Gollas and Kadu Gollas who differ widely in their customs.

The Uru Gollas or Gollas proper have the following endogamous divisions, members of whom, however, eat together:—Onti Chapparamuvallu, Rendu-Chapparamuvallu, Yerra or Kilari, Punagu or Kudi Paitala, Karani, Puni or Puje, Bigamudre or Bokkasa, Kanchu, Racha and Mushti. Yerra or Kilari Gollas appear to be superior to the other divisions and put on the sacred thread during marriages. Bigamudre or Bokkasa Gollas (Gollas of the lock and seal section) are so called because they were the guards of the treasury in former times. Gollas have a large number of exogamous divisions named after some animal, plant or other material, and the members belonging to a particular division are prohibited from eating, cutting or otherwise interfering with the object representing their division. The original language of the Gollas seems to have been Telugu. But those that are living in the purely Kannada parts of the State use only that language. *Illatom* is common in the Telugu parts of the State and an *illatom* son-in-law gets a share in the property equal to that of a son, and in the absence of any sons, becomes sole heir to his father-in-law. Marriage is generally between adults but as in other similar castes there is a feeling that infant marriages are more respectable. Polygamy is rare. A person whether male or female may remain unmarried without incurring any social odium. The bride price is Rs. 15. Widows are not allowed to marry. The husband may give up his wife for her unchastity or loss of caste and the wife may also separate herself from her husband for habitual ill-treatment or his loss of caste. The divorced woman may not remarry. There is no practice of dedicating Basavis. Gollas are Vaishnavas and worship Krishna under various names. Some worship Siva also. Other deities whom they worship are Maramma, Yellamma and Gangamma. Persons dying as bachelors are

deified as Iragararu and their figures are cut on stone slabs as riding on horseback and set up in fields with female figures on either side. The most important feast observed by Gollas is the Sankranti. The presence of Dasayyas is necessary on all occasions of religious ceremonies. The dedicating of men for the service of God as Dasayyas is very common among Gollas. Gollas belong to the 9-Phanas group.

The Kadu Gollas say that they are immigrants from the North. They speak Kannada as they have long been domiciled here. The three primary exogamous septs of the Kadu Gollas are known as Chitta Mnttoru or Karadi Gollaru, Chandinooru and Rame Gaudana Kuladavaru. A pregnant woman in labour is lodged far off from a village and only a Beda midwife is allowed near her. After three months, the mother and the child are brought in. Marriage among them is generally adult but infant marriage may take place. A woman should not die unmarried. The bride price is Rs. 14. A girl first attaining her age has to stop out for 21 days far off from the village. Widows are not permitted to marry. In each hamlet they have a Yajaman who wields extensive powers. In fact, in times of epidemics or calamity, he orders the removal of the settlement *en bloc* to a new site. The hamlets are usually kept very tidy. They worship Vishnu under the names of Krishna, Venkateswara, Rama, Ranga and Vishnu. Their tribal deities are Junjappa, Chikkannaswami, Kyatedevaru, Chitradevaru and Bhutappa. Junjappa, the chief deity, is a glorified shepherd. Before the tribal council the parties swear by Junjappa or by the sacred sheep (*Jennige Kuri*—the sheep is marked by three longitudinal cuts in its ears and is considered sacred). Generally each hamlet has one or more such sheep. (Mys. Eth. Mon.)

Gondaliga (71).—More than half are in the Kolar District. These are mendicants of Mahratta origin like the *Budubudikes* and may perhaps be a sub-division of them. They are worshippers of *Duryi*. Their occupation, as the name indicates, is to perform *gondala* or a kind of torchlight dance, usually performed in honour of *Amba Bhavani*, especially after marriages in Desastha Brahmins' houses, or at other times in fulfilment of any vow. (C. R., 1901.)

Goniga (998).—These are mostly found in Bangalore and Tumkur Districts. The chief occupations are weaving and agriculture. The Gonigas are sack weavers and makers of gunny bags. The known sub-divisions of the caste are the *Janapas* and the *Sadhuwamsasthas*. Some of the latter are agriculturists, while many of the grain porters in Bangalore City are of this sub-caste. They do not wear the sacred thread. Widow marriage is not permitted; girls are married after puberty. The Telugu *Janapas* seem to have twenty-four *gotras*. Some of these are totemistic in their character. (C. R., 1901; C. T. S. I.)

Gosayi (367).—The chief occupations are trade and begging. This is an immigrant caste. The *gosayi* is no caste; commonly any devotee is called a *gosayi*, whether he lives a life of celibacy or not, whether he roams about the country collecting alms, or resides in a house like the rest of the people, whether he leads an idle existence or employs himself in trade. The *Gosayis* although by profession belonging to the religious class, apply themselves nevertheless to commerce and trade. They never marry. Any casteman can become a *gosayi* and unite with the members of this fraternity in eating and drinking; but if this is done, the person is not admitted to his original caste. (C. R., 1901.)

Gujar (H.—156; M.—36).—They are enumerated in the Civil and Military Station, Bangalore. The actual workers of this caste are mostly soldiers in the British army. The *Gujars* are a pastoral tribe, the majority of whom have in recent times espoused the Muhammadan faith. With the *Jats* they form the backbone of the rural population of the Punjab though inferior to them in civilization, industry and agricultural skill.

Gurkha (11).—They have been enumerated in Mysore City. The actual workers are Military pensioners employed as Palace bandmen. The caste has immigrated into the country from the North.

Gujarati (188).—These are found chiefly in the Mysore City and the Civil and Military Station, Bangalore. Their chief occupation is trade. These are immigrants from Gujarat and are followers of Vallabhacharya.

Holeya (613,248).—These are found everywhere, but they are not so numerous in Chitaldrug and Tumkur Districts. The traditional occupation is that of either a village watchman or an agricultural labourer. Nearly one-fifth of the number of actual workers follow the traditional occupation. They furnish the bulk of the ordinary and mining labourers. The word '*Holeya*' is, literally speaking, a person of the land and probably points to the origin of the caste. The *Holeyas* may have been the original dwellers of the country, who were subjugated and made to be labourers attached to the land, by in-coming settlers in times beyond memory. The derivation of the word from '*hole*' or pollution does not seem to be correct for we are not positive whether the uncleanly habits were the resulting effects or the causing factors of the degraded condition of the caste. The *Holeyas* form the bulk of agricultural labourers in the State. In Mysore they generally speak Kanarese, Tamil, Telugu and Marathi being used by small sections of them according to the place of their origin. The *Holeya* belongs to the 18-Phanas section of the community, of the meetings of which he is the convener when he goes forth carrying a brass cup and chain as insignia, the cup having on it engraved the badges of different castes composing this section, such as the plough of the Vakkaliga, the scales of the Banajiga, the shears of a Kuruba, the spade of a Vodka, the razor of a barber, the washing stone slab and pot of an Agusa and the wheel of a Kumbara. The caste *Holeya* has a number of sub-divisions, the principle of division being language, profession or place of residence or two or more combined; and these groups are all said to be endogamous. Kannada-speaking divisions are *Gangadikara*, *Morasu*, *Dasa*, *Magga* (weaver), and *Hagga* (rope-maker). The Telugu groups are *Pakinati*, *Chintalu*, *Gundlu jagati*, *Rampalu*, *Pasupasere* and *Savu*. *Konga*, *Dyaval*, *Mastikaru*, *Gogla*, and *Kudare* are of Tamil origin. A small number of Marathi-speaking

Holeyas are found scattered over the country on the borders of the Bombay Presidency. Tamil Holeyas take food in the houses of Kannada and Telugu sections, while the latter do not return the compliment, regarding the Tamil Holeyas as inferior in origin. The *Gangulikara* Holeyas are regarded as the highest in rank. The Holeyas have a number of exogamous divisions or *Kulas*. Those who perform the worship of their gods are known as *Devaraguddas* the relation of these to others of the caste being hypergamous. Holeyas girls are married either before or after puberty. If a girl remains unmarried from the absence of suitors, she is married to trees, Honge (*pongamia glabra*), Bevu (*margosa*), Yekke (*calotropis gigantea*), and dedicated to shrines like those of *Biligiri Ranga* or *Siddappaji*. She may then live with any man of the caste without losing status. She inherits then the rights and privileges of a son. Her children belong to her father and are legitimate. A father may also dedicate his daughter to the patron deity having made a vow during the child's illness. This system is not in vogue among the *Gangulikara* and *Morasu* Holeyas but is general among the rest. The bride price is stated to be Rs. 12-13-4 at Channarayana, Rs. 25 at Koppa and Rs. 15 at Nanjangud. The marriage of widows is permitted. Divorce is permitted at the desire of either party, for infidelity on the part of the wife or even without such a ground if they agree to part, provided she pays a fine to the caste. Holeyas do not perform *Shraddhas*. The Holeyas live in a hamlet separate from the village called *Holageri*. Though very rarely, recruits from other castes are taken into the fold after a ceremony. Sons divide the father's property equally, the youngest son having a right of selecting the first share. A son-in-law who resides with his father-in-law receives an equal share with his brothers-in-law. Holeyas cannot use the village well and the village harrier and washerman do not render services to them. Holeyas are either *Saivas* or *Vaishnavas*. They pay homage chiefly to the images which personify the inimicant powers and bloodthirsty qualities, e. g., *Mariamman*, *Saugamma*, *Mastamma*, *Baire Devaru*, *Manigamma*, *Hindamma*, *Mutyalaamma*, *Patalamma* etc. The religious itinerant mendicants among them are known as *Dasa*, *Jogi*, *Devaragudda*, *Bidimounshya*, or *Nilagavaru*. Satanis are generally the priests of Holeyas. Sometimes a nun of Lingaynt caste and a *Tirukala Dasa* of the Vishnu cult also sometimes serve as priests.

The Holeyas manufacture coarse cotton cloth; some are engaged in hotel vine gardening. The *Aleman* sub-division furnishes recruits to the local infantry as sepoyas. In purely *Malnad* Taluks, some Holeyas on estates were considered *serfs* either as *Huttalu* or going with the family of the landlord or as *Mammatu* or going with land when it changes hands. (*Mys. Eth. Mon.*)

Idiga (38,758).—The caste is found in all the districts especially in Mysore, Tumkur and Shimoga Districts. The traditional occupation is that of toddy drwer, and it is followed by one-sixth of the number of actual workers of the caste as the principal occupation. The chief occupations are cultivation, labour and trade. Their language is Telugu, and except in the Western districts where they have forgotten their original language and adopted Kannada, they speak it at home. The Idigas are immigrants from the Telugu country. The two main endogamous divisions are (1) *Maddi* or *Sada* or *Uru* Idigas and (2) *Bellada* or *Eni* or *Kada* Idigas. The two exogamous divisions of the caste are styled *Sasmejavaru* and *Bodeyavaru*. Polygamy is allowed. Marriage of adults is the rule. The bride price is Rs. 15. Widow marriage styled *Kudike* or union is generally allowed though it does not find favour. A man cannot divorce his wife for any other reason than that of adultery or loss of caste and the wife can separate herself from her husband only if the latter is thrown out of caste. Idigas do not dedicate *Basavis*. They make offerings to the ancestors generally on the Mahalaya new-moon day and on the New-year's day but they do not perform any anniversary *Shraddhas* for the dead. The Idigas are of the 18-*Phanus* section. They consider bullocks sacred and never use them for carrying toddy. Brahmans are allowed to minister to them as priests and are employed on marriage and other festive occasions. They are also called in to purify houses after pollution of death. They have a *Sri Vaishnava* Brahman known as *Tatacharya* of Tirumale as their *guru* and some have Satani *gurus* likewise. Outsiders belonging to any recognised higher castes such as Vakkaligas may be admitted into their caste, though such admissions occur very rarely. Idigas worship *Siva* and *Vishnu*. They pay homage to *Munisvara*, *Mariamman* and *Durgi*. Their special gods are known as *Katamadavaru* and *Yellamma*. Idigas have a class of beggars known as *Emutivallu* who visit them periodically and receive some presents.

Iruliga (H.—154; A.—1,889).—These are found mostly in the Bangalore District. The chief occupations are cultivation and labour, specially in collecting forest produce. (The figures for castes of Iruligas and Soligas were combined together in the Census Report of 1901.) The language of these people is Tamil mixed with Kanarese and Tolu words spoken in a strange tone. They are found chiefly in the hilly tracts of Kankanahalli, Closepet (Sub) and Magadi Taluks. They live on roots, herbs, fruits and ragi. They say they are settlers from the Anamalai forests below the ghats. (C. R., 1901.)

Jat (H.—38; M.—23).—These people are immigrants from the North. The Hindu Jats are found in the Kolar Gold Fields engaged in mining, while the Muhammadans are found in the Civil and Military Station, Bangalore, employed in the army.

Jogi (12,881).—These are found chiefly in the districts of Bangalore, Kolar and Shimoga. Cultivation and begging are the occupations followed. These are a caste of Telugu beggars. Besides begging, they employ themselves in snake-charming and pig-breeding.

The *Jogis* are composed of devotees recruited from all castes. They are also called *Sillekyata*, *Helava*, *Jangaliga* and *Pakanati*. The two latter deal in medicinal drugs and wander about calling out the particular diseases which they profess to cure by means of their medicaments. (C. R., 1901, 1891.)

Kahar (73).—These are found in the Civil and Military Station, Bangalore, Mysore City, and Mysore District. The chief occupation is transport. The caste is the important domestic

servant class of Northern India. It is said that in every well-to-do family there is at least one *Rawani* (member of a sub-caste of Kahars), to serve as 'maid-of-all-work.' (B. H. C.)

Kanakkan (186).—This caste is found mostly in the Kolar Gold Fields, Kolar District and Civil and Military Station, Bangalore. The chief occupations are mining and trade. Kanakkan is a *Tamil accountant caste*, found chiefly in North Arcot, South Arcot and Chingleput. They are generally *Sairites* and their title is *Pillai*.

Kayastha (17).—This caste is found mostly in the Bangalore City and Civil and Military Station, Bangalore. The Kayasthas are the great writing caste of Bengal.

Komati (9,813).—This caste is found all over the State. They are the well-known caste of traders, four-fifths of the number of actual workers following the traditional occupation. The language of the caste is Telugu. They have a number of *gotras* or exogamous divisions. The girls are married before puberty and polygamy is allowed though rarely practised. In the matter of religious ceremonial, they closely follow the practices of the Brahman caste.

Koracha (H.—6,126; A.—14,579).—This caste is found all over the State, specially in Kolar and Shimoga Districts. The Korachas are a wandering tribe. They are known as *Erukulas* in the Telugu country, as *Koravas* in the Tamil tracts, *Koramas* or *Korachas* in the Kannada tracts and as *Koravis* or *Kaikaris* in the Malhatta country. There are four endogamous divisions—*Uru* or *Dabbe*, *Uppu* or *Ghattada* or *Ettina*, *Kunchiga* and *Sonai*. *Uru* Korachas are so called because they have settled down within towns and villages. They are agriculturists but also make baskets and their women practise tattooing and fortune-telling. *Uppu* Korachas trade in salt. *Kunchiga* Korachas are those who manufacture *Kunchige* or the brush used by weavers for starching their yarn. *Sonai* Korachas get their name from a wind instrument on which they play and are snake charmers generally. They have four exogamous divisions—*Satpadi*, *Kavadi*, *Menpadi* and *Mendragntti*. The Korachas seem to have traces of the custom called *Convade*, according to which, when a wife is delivered of a child, the husband is confined to bed and treated as a delicate patient. The practice seems to be dying out and exists only in remote parts in Shimoga District and elsewhere (*vide* also Madras Museum Bulletin, Vol. IV, No. 2, pp. 115-6). Marriage is generally celebrated after puberty. Polygamy is allowed. The bride price is Rs. 72. Widow marriage is freely allowed. Divorce is allowed on account of the wife's adultery. They do not perform *sraddhas*. *Uru* and *Sonai* Korachas are more or less a settled people. They have no objection to take into their fold persons of other castes who are higher in the social scale, except, it is said, a Brahman. Korachas belong to the 18-Phanas section. For an account of tattooing see Census Report of 1901, Chapter VIII, p. 556 *et. seq.* Korachas worship God Venkataramana of Tirupati. The chief female deities worshipped by them are *Durgamma*, *Halagamma*, *Mathangamma*, *Gangamma*, *Madduramma*, and *Yellamma*. (Mys. Eth. Mon.)

Korama (H.—165; A.—6,118).—These are found chiefly in Bangalore District. (*Vide* notes on Koracha caste.)

Kshattriya (37,927).—They are found in all districts, the Mysore District (including Mysore City) returning a little more than one-fourth the number. The traditional occupation of Military service is followed as principal means of livelihood by one-seventeenth of the number of actual workers; nearly half the number are either rent receivers or rent payers, the rest being engaged in industry, trade, Government service, etc. Among the castes grouped under 'Kshattriya' are the *Arasus*, of whom are the ruling dynasty of Mysore, *Rajpnts*, *Coorgs*.

Kumbara (41,810).—Two-fifths of their number are to be found in the Mysore District. The traditional occupation is that of potters, fully half the number of actual workers following the same as principal means of livelihood. Cultivation is the other chief occupation of the caste. There are three main divisions among the Kumbaras: (1) *Telugu* Kumbaras otherwise known as *Sajjana* Kumbaras, (2) *Kannada* Kumbaras and (3) *Lingayat* Kumbaras. There are said to be two more divisions, *Kudipaitala* and *Tamil* Kumbaras, the latter being very few in number. These divisions are endogamous and sometimes do not eat together. The *Lingayat* Kumbaras follow the rites and ceremonies peculiar to that sect and have *Jangamas* for their priests. There are a number of exogamous sub-divisions in each division. Marriage may be infant or adult, the bride price varying from Rs. 25 to Rs. 50. Polygamy is permitted. Widow marriage is allowed. Divorce is not popular and takes place only among the more backward portion of the caste living in villages. They do not observe *sraddhas* but on the Mahalaya new-moon day, they offer rice doles and money to Brahmans to propitiate all the deceased ancestors. Kumbaras worship both *Siva* and *Vishnu* as well as local deities. (Mys. Eth. Mon.)

Kuruba (403,366).—This caste is found in all districts, two-fifths of the number returned being in the Mysore District. The traditional occupation is that of shepherds and wool weavers, the same being followed, as principal means of livelihood, only by about one-fifteenth the number of actual workers returned for the caste. More than two-thirds are agriculturists, rent payers, and rent receivers. The Kurubas form an important portion of the population of the country. *Gauda* and *Heggade* are the titles used by them. The Kurubas are said to be the modern representatives of the ancient *Kurumbas* or *Pallavas*, who were once so powerful throughout Southern India. Their language is Kannada but some who are living in the taluks bordering on the Telugu districts, as Mulbagal for instance, have adopted Telugu as their home speech. The three main endogamous divisions are *Halu* Kurubas, *Ande* and *Kambli* Kurubas. The *Halu* Kurubas form by far the largest and most important division, who abstain from liquor. The *Kambli* Kuruba division is said to indulge in drink. The caste contains a large number of exogamous divisions, many of the names of these *Kulas* being totemistic in their origin. There are no hypergamous divisions, but the *Samanti* Kula (exogamous division) is considered superior to others, and the *gurus* or the *pujaris* of the caste are drawn from this sept. These do not eat flesh or drink liquor: wear a

linga round their necks, and do not eat with others. They can take wives only from the 'Ane' and *Gali* sects. Marriages are generally adult but infant marriages are also common. It is not compulsory that a woman must be married. The Kurubas have their own *Pujari* to officiate at marriages and do not generally invite Brahmanas as priests except where their casteman called *Revanayya* is not available. The bride price is Rs. 12. Widow marriage is permitted. A husband may divorce his wife on account of her unfaithfulness. The practice of dedicating girls as Basavis exists in some places. Generally the oldest girl is so dedicated, either when there are no sons to continue the line or in pursuance of a vow. The Basavi is considered as entitled to inherit her father's property as a son. Kurubas do not perform *sraddhas* but they worship all the ancestors generally on the Muhakya new-moon day and on the *New-year's day*. They do not admit outsiders to the caste. Questions affecting inheritance, etc., if they are not of a complicit nature, are inquired into and settled by the village panchayat, including the Patel and shanbhog. The Kurubas are a well-organised community. The whole caste is divided into a number of territorial divisions, at the head of each is a *gaula* or *headman*. There is a *Nadu* gaula who has jurisdiction over several *gaulas*. Some Kurubas call in Lingayat and Brahman priests to assist at auspicious ceremonies. The Kurubas are *Saivas* but worship all Hindu gods. Their tribal deity is *Bira* or *Vira* a name of Siva. The other deities are *Mailara*, *Batyappa*, *Irachikkappa*, *Badalappa*, *Yellamma*, *Lakshmidri*, *Karakurappa* etc. The chief place of pilgrimage is Mailara in the Bellary District. (Mys. Eth. Mon.)

Ladar (1,038).—More than one-third have been returned in the Mysore District (including Mysore City). The traditional occupation, *viz.*, trade, is followed as principal means of livelihood by one half the number of actual workers returned for the caste. The Ladars are a class of general merchants, found chiefly in cities. They are said to have come from Benares to Mysore under pressure of famine 700 years ago. There is a division of *Baniyas* in Gujarat known as '*Lad*.' The Ladars wear the sacred thread and they have *gotras* like the Brahmans. They claim to be Kshatriyas. Girls must be married before the tenth year. Their goddess is *Bharani*. They abstain from meat and liquor.

Lingayat (729,431).—The community is found all over the State, Mysore, Chitaldrug, Shimoga and Tumkur Districts returning the largest numbers. They are found engaged in all occupations—agriculture, commerce, public administration and the professions, nearly the four-fifths of the number of actual workers being rent-receivers and rent-payers.

The term 'Lingayat' is properly not a caste but a religious designation combining several castes. It is a popular designation but the caste people call themselves Virasaivas, Sivahuktas, or Sivachars. For an excellent account of the Lingayats the reader is referred to pages 529-35 of the Mysore Census Report, 1901. A note on the Lingayat mutts is given below.

There are five great religious centres of the Lingayats and these are situated in different parts of India as follows:—(1) Ujjani, Kudligi Taluk, Bellary District. (2) Balehonnur, Koppa Taluk, Kadur District, Mysore State. (3) Benares or Kasi. (4) Himavatkotara in the Garhwal District and (5) Srisaila *alias* Puvata in the Cuddapah District.

The famous teachers who established these seats were Marulacharya, Renukacharya, Viswacharya, Ekommacharya and Punditacharya, respectively. The seat of Srisaila has now been removed to a place called Harahalli, Hospat Taluk in the Bellary District. Kollipaki is another mutt of some reputation established by Renukacharya of Balehonnur and is considered to be a branch of the latter mutt. Kollipaki, however, has branches of its own and there is one such branch even now in the Mysore City. Balloipalli in the Hosur Taluk and Rajapuram near Anekul are branch mutts of Balehonnur. Vibhutipuram, Gummalapuram, Bellary and Tiruvannamalai are all branch mutts belonging to one or other of the five great centres referred to above.

Each of the five principal mutts is called a '*Simhasana*' (throne) and has sub-mutts in important popular centres under the management of *Pattadaswanis* (who are *Brahmacharis*). Each sub-mutt has a number of branch mutts called *Gurusthala* (*Grihastha*) mutts and these latter are to be found wherever a community of Lingayats exists. The rights and duties of the *Sranis* (*heads*) of these mutts are to preside in all religious functions, to receive their dues, to impart religious instruction, to settle all religious and caste disputes and to exercise a general control over all matters affecting the religious interests of the community at large.

Another order of priests exists called *Viraktas* also known as *Shasthala Nirabharis* who hold the highest position in the ecclesiastical order and therefore command the highest respect from laymen as well as from the abovementioned mutts. There are three chief *Virakta* mutts and these are (i) the *Muragi* mutt in Chitaldrug, Mysore State, (ii) the *Dombal* mutt in Gadag, Dharwar District, and (iii) the *Moorusavirada* mutt in Hulli, Dharwar District. These mutts have also their respective sub-mutts and branch mutts all over India and exercise jurisdiction over all the *Viraktas* and the general body of the Lingayats. Every Lingayat centre has a *Virakta* mutt built outside the town in which the Swami leads a simple and spiritual life. Unlike other priests, the *Viraktaswami* is prohibited from presiding on ceremonial occasions and from receiving unnecessary alms. He should devote his life partly to spiritual modification and partly to the spreading of spiritual knowledge among his disciples, so that he would be the fountain head, to whom all laymen and all priests must resort for spiritual enlightenment; in short, his position is that of a pure *sannyasi* or *yati*, of the most exalted order. (Memorandum by Rajasabhabhushana Dewan Bahadur K. P. Puttanna Chetty, Esq., late Senior Member of Council, Mysore State.)

Lambani (H.—9,945; A.—41,223).—A little less than one-third of the total number are to be found in the Shimoga District; the rest are found distributed among the other districts, Kolar and Mysore Districts returning the fewest numbers. About one-ninth of the number of actual workers are engaged in cultivation. Labour (agricultural and other) and petty trade are the other occupations chiefly followed. The Lambanis are locally known as *Sukalis*, *Sukaligas* and *Binjaras* or

Binjaris. The women wear a peculiar dress and ornament themselves with cowries and bangles made of metal and bone. The Lambanis own the *Gosayis* as their priests or *gurus*. The Lambani outcastes comprise a sub-division called '*Thalya*' who like the Holeyas are drumbeaters and live in detached habitations. The Lambanis live in clusters of huts called '*Thandas*.' There is a *Naik* or headman of a *Thanda* and he has extensive powers over his fold. Females are married after puberty. The bride price is Rs. 21 or Rs. 41 with 4 bullocks. Widow marriage and polygamy freely prevail among these people. The Lambanis are Vaishnavites and their principal object of worship is *Krishna*. *Banasakkari*, the goddess of forests, and *Basava* are also worshipped. During the marriages, the women weep; probably this is a relic of marriage by capture of bride and the officiating priest is jocularly handled by the women; milk is poured by the bride and the bridegroom into an ant-hill where a snake is said to live. The Lambanis were the noted carriers by packbullocks following the armies in the wars of the 18th and 19th centuries. With the restoration of peace and order, their occupation was well-nigh gone and some took to robbing. The habit of drinking prevails among persons of both sexes. (C. R., 1901, 1891.)

Madiga (308,083).—The caste is most numerous in Tumkur, Bangalore, Kolar and Chitaldrug Districts. They are, by tradition, workers in leather but hardly one in twenty of the actual workers returned follows the occupation now. A little less than one-third are cultivators while four-ninths subsist by labour (agricultural and other). Madigas belong to the 9-Phanas group of castes. They speak Kannada or Telugu according to the locality they live in. There are some immigrants into the State from the southern parts of the Madras Presidency and these speak Tamil; but their number is insignificant. Among the Kannada and Telugu Madigas (who do not intermarry) there are three endogamous divisions:

- (1) *Tavige Burradavaru* or *Tale Burranavallu*;
- (2) *Heilige Burradavaru* or *Ganpa Burranavallu*; and
- (3) *Moca Burradavaru*.

There are two other divisions known as *Jambavas* and *Dakkaloru*. The Jambavas are the *gurus* of the Madigas and consider Panchalas as their patrons. The Jambavas talk Telugu and among them hypergamy prevails, their women not being allowed to marry into the other divisions. Dakkaloru are considered to be the *Halawakkalu* (hereditary bondsmen) of the Madigas and are treated by them as outcastes. Madigas have a number of exogamous divisions known as *kulas* named after trees and animals. There is no limit of age for marriage in either sex. Polygamy is allowed. The bride price is Rs. 12. Widow marriage is allowed and freely practised. Divorce is granted for adultery. Dedication of girls as *Basavis* is common in this caste. Some families have the custom of devoting the eldest girls to this life; while in many cases, a girl is so dedicated in pursuance of some vow taken at a time of illness or other distress. They do not perform *Sraddhas*. Madigas reside in quarters outside the main village and apart from *holegeri*. They are not allowed to use the common village well. Madigas freely take in recruits from all castes except Holeyas. The Madigas worship *Mariamamma*, *Masammamma*, *Matangi*, *Pujamma*, *Akkayamma*, *Kalamamma*, *Chotdamamma*, *Ducamma*, *Gangamma* and *Yellamma*. Their patron saint is *Aralappa*. A section among them known as *Desabhagadavaru* are Vaishnavas, having as their gurus Satanis or Srivaishnava Brahmins. It is stated that a Western Chalukya king Mangalesa (567-610 A. D.) conquered the Mutangas. Who these were has not been definitely settled and it is conjectured that they were hill tribes and that Madigas are their descendants. (Mys. Eth. Mon.)

Mahratta (45,898).—Nearly one-third of the number reside in Shimoga District. Three-fifths of the remaining numbers live in Bangalore (including Bangalore City and Civil and Military Station, Bangalore), Mysore (including Mysore City), and Tumkur Districts. More than a third of the actual workers are engaged in cultivation of land. The other occupations chiefly followed are service in the Military and Police forces, industry and trade. The Mahrattas are called *Ace* by the people in Mysore. They are the military caste of the Mahratta country. The lower classes of Mahrattas do not go through the ceremony of *Upanayana* or investiture with the sacred thread; but they take it at the time of their marriage. Brahmins minister to them as their priests. The Mahrattas have two main divisions among them. The branch called the 'seven families' has a superior status. The great Sivaji belonged to this division. The other division is called that of the 'Ninety-six families.' Some Mahratta families are connected by marriage with Rajput clans. (B. H. C.)

Malayali (1,448).—A little more than half the number are found in the Kolar Gold Fields and Kolar District. Nearly half the number of actual workers returned are engaged in mining on the Kolar Gold Fields. The name is given to persons belonging to immigrant castes from Malabar who are not Nayars.

Maleru (H.—1,756, A-1).—These are found mostly in the *Malnad* districts of Kadar and Shimoga. The chief occupations are returned as cultivation and labour. The traditional occupation is that of temple servants. In some temples of the *Malnad* there exists a set of females who though not belonging to the *Natuvu* class are yet temple servants like them and these are known by the name of *Maleru*. Any woman who eats the sacrificial rice strewn on the *Balipitani*, at once loses caste and becomes a member of this caste. The children of *Maleru*s by Brahmins are termed *Golakas*. (C. R., 1901; C. T. S. I.)

Maravan (15).—The members of this caste are enumerated in the Civil and Military Station, Bangalore. The actual workers are engaged in the public forces. The Maravans are chiefly found in Madam and Tinnavelly Districts of the Madras Presidency.

Marwadi (H.—226; J. 317).—These traders and bankers from the North are found mostly in the towns. The Jain Marwadis are all Svetambaras and the local Jains, who are Digambaras, do

not mix with them. 'Marwadi' means a native of Marwar in Rajputana; but it should be noted the designation as commonly used is not strictly confined to the meaning.

Meda (6,778).—Medas are found in all districts of the State, specially in Mysore and Shimoga Districts. These persons are mat-makers and cane-splitters by traditional occupation, more than three-fifths of the actual workers returning the same as their principal means of livelihood. The Medas are divided into two linguistic divisions, Kannada Medas and Telugu Medas. The endogamous divisions are:—(1) Gavarigas, found only in the Mysore District, (2) Palli Medas and (3) Bandikara Medas. The exogamous sects are in the case of Gavarigas, *Bellikula* and *Nagarakula* in the case of Palli Medas who probably originally immigrated from the Tamil Country, *Alukula*, *Sampigekula*, *Karekula* etc. Among the Bandikaras, *Nayakan Bidu*, *Masakanni Bidu*, *Gandana Bidu*, *Pattara Bidu*. Polygamy is allowed but is not generally practised. Girls may be married before or after puberty. Widow marriage is allowed and freely practised. The bride price varies from Rs. 12 to Rs. 24. Divorce is permitted on account of the wife's adultery or the husband's loss of caste and sometimes on account of continued disagreement. Medas do not dedicate girls as Basavis. They do not observe *sraddhas*. There are both Saivas and Vaishnavas among the Medas. Saivas sometimes become Devaraguddas (religious mendicants) and Vaishnavas, Dasaris. The tribal deity is known as *Dargamma*, *Kukkavadagamma*, *Malamma* and *Chandamma*. They belong to the 18-Phanus section. Each of the endogamous divisions has a tribal constitution independent of other divisions. (Mys. Eth. Mon.)

Mochi (1,287).—The Mochis are found chiefly in Mysore (including Mysore City) and Shimoga Districts. The traditional occupation is that of leather workers and five-eighths of the number of actual workers of the caste follow the same as principal means of livelihood. They are immigrant Mahrattas, who, it is said, came to Mysore with Khasim Khan, the General of Aurangzib. They are shoemakers and saddlers by trade and are Saivas by faith. The Mochi is not a tanner and as a leather worker only engaged in the higher branches of the trade. (C. R., 1901; C. T. S. I.)

Mudali (17,896).—More than a third have been enumerated in the Civil and Military Station, Bangalore; Bangalore and Kolar Districts (including the cities situated there) contain a similar number. Nearly a fifth of the number of actual workers are engaged in industries as artisans and workmen; the other chief occupations are trade, Government service and mining. Most of these are immigrants. Mudali is the title of the great farmer caste of the Tamil country. The Vellalas of the Madras Presidency are described as "a peace-loving, frugal and industrious people, and in the cultivation of rice, betel, tobacco, etc., have perhaps no equals in the world. Some are well educated and employed in Government service and as clerks, merchants, shopkeepers, etc., but the greater part of them are the peasant proprietors of the soil and confine their attention to cultivation." (C. T. S. I.)

Multani (28).—These were enumerated in the Cities of Bangalore and Mysore. These are immigrant traders from the North. The name denotes that they are from Multan in the Punjab.

Nagarta (7,782).—Four-fifths of the number reside in the Bangalore and Kolar Districts (including the cities situated therein). The traditional occupation is trade and is followed by one-half of the number of actual workers returned at this Census. Nagartas are principally found in towns and large trade centres. Some are worshippers of Vishnu, others of Siva. Of the latter, some wear the *linga*. They are dealers in bullion, cloth, cotton, drugs and grain. Marriage must be performed before a girl reaches puberty and widows are not allowed to marry. Polygamy is allowed and divorce can be for adultery alone. It is said that Nagartas are co-emigrants with Ganigas to Bangalore where one Mullaraj Ars made headmen of the principal members of the two castes and exempted them from the house tax. It is recorded that the Nagartas originally hailed from Kanchipuram (Conjeeveram) where, it is said, a thousand families of this caste formerly lived. Their name (Nagaram a city) refers to their original home. They wear the sacred thread. They closely imitate the Brahmanical ceremonies of marriage and death. (C. R., 1901, 1891; C. T. S. I.)

Natuvu (1,745).—The members of this caste are found chiefly in Bangalore and Kolar Districts (including the cities situated therein). The traditional occupation is that of singing and dancing, about one-fifth of the number of actual workers returned following the same as their principal means of livelihood. At nautch parties, the women dance, the males playing the accompaniment on the drum, the nagpuri, flute, clarinet, cymbals, etc. The Natuvu comprises the sub-divisions of Natuvus, and Kaikolas (a caste of Tamil weavers, among whom it seems there is a rule that in every family, at least one girl should be set apart for and dedicated to temple service. So long as this girl or her descendants, born or adopted, continued to live, the family concerned does not dedicate another girl). The Natuvu is strictly speaking not a caste, the individuals in the category being in many cases, either affiliated to or born in it. The Natuvus who speak Telugu belong to the Telugu Banajiga caste, while the Kannada-speaking Kaikolas are said to be a sub-division of the Lingayats. The Natuvus have, however, at the present day a distinct caste organisation of their own. (C. R., 1901; C. T. S. I.)

Nayar (785).—Nearly three-fifths of this number have been enumerated in the Kolar Gold Fields and Kolar District. The mining industry engages more than half the number of the actual workers of the caste. The Nayars are the well-known middle class community of Travancore. The Nayars found in Mysore are mostly immigrants.

Nayinda (39,414).—The caste is found in all districts, the Kolar and the Mysore Districts (including the cities situated therein) containing each more than one-fourth of the total number. The traditional occupation is that of barbers, nearly one-half of the actual workers returning the same as their principal means of livelihood. The other chief occupation is cultivation of land. Nayindas belong to the 18-Phanus section of the community. The main divisions of the caste are Kannada and Telugu (according to the languages they speak). The endogamous divisions

of the Kannada section are *Morasu*, *Uppina* and *Silavanta*. (The *Silavantas* are Lingayets in faith and are strict vegetarians and do not touch liquor.) The Telugu section has the following endogamous divisions—*Nadigaru*, *Raddibhumi*, *Gundlajagata* and *Kudipaita*. The exogamous divisions of the Telugu section are named after plants, flowers, animals and other objects, with the usual prohibition against killing, cutting or using them. There are some *gotras* in the Kannada section. Polygamy is allowed but seldom indulged in. A woman may be married at any age or may remain unmarried altogether. Remarriage of woman is prohibited in some sections of the caste, while the majority allow it. There is no dedication of Basavis. The *Silavantas* have *Jangamas* as their priests. Some invite *Satani* priests. The *Nayindas* do not perform annual *Sraddhas*. They do not shave the *Holeyas* and *Madigas* and do not play the musical instruments at the marriages of these castes and also of *Agasas*, *Kornelas* and *Voddas*. *Nayindas* are professional musicians. They were formerly village surgeons, but this occupation has fallen into desuetude. Women of this caste were employed as midwives and even now in remote villages, many have still that vocation. The *Nayindas* worship both *Siva* and *Vishnu*. The other deities worshipped are *Munisrara*, *Akkagaru* (the sisters—who are regarded as spirits of the woods and trees), *Ganganma*, and *Gramadevata* as *Maramma* or *Sidviramma*. (Mys. Eth. Mon.)

Neygi (96,466).—These are found all over the State, the Bangalore District (including Bangalore City) containing nearly one-fourth of the total number returned for the State. The traditional occupation is that of weavers, calenderers and dyers, a little more than one-half of the number of actual workers returned following the same as their principal means of livelihood. The other chief occupations are agriculture and trade. 'Neyige' is occupational name of the silk and cotton handloom weavers of the State and includes the following well-known divisions: *Bilimugga*, *Devanga*, *Khatri*, *Patvegar*, *Sale*, *Sourashtra* (*Patnulkaran*), *Seniga* and *Togata*. These divisions are quite distinct, there being no intermarriage or no social intercourse.

(a) **BILIMUGGA**.—Otherwise called *Kuruvina Banajiya*. They speak Kannada. There are two endogamous divisions—Lingayats and those that are not Lingayats. There are sixty-six exogamous divisions. There is no age restriction in marriages. The bride price is Rs. 25. Marriage of widows is permitted. Adultery on the part of the woman is the only ground for divorce. They do not admit outsiders into the caste. The Lingayat section do not eat flesh or drink liquor. They worship *Nilkantesvara* and *Narasimhaswami*. *Saugamesvara* is their patron God. Those that are not Lingayats employ Brahmans for religious and ceremonial purposes. The name '*Bilimugga*' comes from the white cloth that is woven.

(b) **DEVANGA**.—The main divisions are *Kanarese* and *Telugu* based on the language they speak. The *Kanarese* section have adopted Brahmanical ceremonies to a greater extent than the *Telugu*, who are more conservative. Those who wear the sacred thread, seem to preponderate over those that do not wear the thread, in the *Kanarese* section. The *Telugu* section has many exogamous sects. The majority of *Devangas* are *Saivites* and some wear the *lingam*. The *Kanarese* section worship *Siva*, *Parvati* and *Ganesha*, who is considered as a special patron of their looms. They do not eat animal food or drink spirituous liquors. Among the *Telugu* sections some worship *Vishnu* and the others *Siva*. The difference in belief is no bar for intermarriage, the wife always adopting the religion of the husband. The tribal goddess of the *Devangas* is *Chandesvari*, a form of *Kali* or *Durga*, in whose honour there is an annual festival, in which the entire community takes part either at the temple or at a house or grove specially prepared for the occasion.

(c) **KHATRI**.—The *Khatri* are the silk weavers and in manners, customs and languages, are akin to the *Patvegars* but do not intermarry with them, though the two castes eat together. They are *Saivites*. They speak a dialect of *Marathi*. The caste title is *Sa*.

(d) **PATVEGAR**.—The *Patvegars* are the silk weavers. They worship all the Hindu deities, especially *Sakti*. They speak a corrupt conglomerate of *Gujarati* and *Hindi*.

(e) **SALE**.—The *Sales* comprise the clans of *Padmasale* and *Pathasale*, who are worshippers of *Vishnu* and the *Sakunasale* who are worshippers of *Siva* and wear the *Lingam*. The two sects do not intermarry. They are of *Telugu* origin. *Padmasale* speak *Telugu* and the other two *Kannada*.

(f) **SOURASHTRA**.—These are commonly known as *Patnuli* or *Jamkhanwala*. These people were originally immigrants from Northern India. With silk they manufacture a fabric called *kutni* which no other weavers are said to be able to prepare. They manufacture superior kinds of cotton and woollen carpets and an imitation shawl of cotton and silk mixture and of green colour called *khes*. They are *Vaishnavites*. Their hereditary *gurus* are *Sri Vaishnava* Brahmans. Marriage of girls before the age of puberty is obligatory among them and marriage of widows is not permitted.

(g) **SENIGA**.—The *Senigas* are a wealthy caste of weavers. They are immigrants from the lower *Carnatic* and specially manufacture cloths for female wear, of superior kind and high value. They are *Lingayats* by religion.

(h) **TOGATA**.—The *Togatats* are of *Telugu* origin (being most numerous in the *Cuddapah* District of *Madras*) and worshippers of *Siva* in the form of his consort *Chandesvari*. They manufacture coarse kinds of cloths that are worn only by the poorer classes. They are generally *Vaishnavites* and have for their priests *Sri Vaishnava* Brahmans or *Satanis*. (Mys. Eth. Mon.; C. R., 1901, 1891; C. T. S. I.)

Panchala (128,098).—One-fourth of the number are found in the *Mysore* District (including *Mysore* City); the districts of *Bangalore* (including *Bangalore* City), *Hassan* and *Shimoga* return nearly half the remaining number. The traditional occupations are those of goldsmiths, carpenters, blacksmiths, brass and copper smiths, masons and goldwashers. More than five-ninths of the number of actual workers returned for the caste follow the traditional occupations. The other chief occupation is agriculture. The word '*Panchala*' refers to persons following the five professions or

thousand songs) which is in Tamil. In their social and religious customs, all the sub-divisions closely imitate the Tungalai Vaishnava Brahmans. (C. R., 1901; C. T. S. I.)

Sillekyata (982).—The members of the caste are found mostly in the Chitaldrug and Shimoga Districts. Some of the actual workers are fishermen and others are strolling players. They are Malirattas by origin and speak that language. One section of these who fish in rivers are known as *Harude Bestas* on account of their using dry gourds to swim in water while fishing. The other section are a wandering tribe of picture showmen known as *Bombe Atadararu*. They worship *Mahaleva* and *Dugamma*. They have a strong caste constitution, the head of the caste being styled *Ganachari*. (Mys. Eth. Mon.)

Soligaru (11--101; A. 1,796).—They are mostly in the Mysore District. The actual workers of the caste are engaged in cultivation and ordinary labour. These inhabit the depths of the forests clothing the foot and slopes of the Biligiri Rangan hills. They cultivate with the hoe small patches of jungle clearings. Their chief God is *Biligiri Rangaswami*, but they also worship *Karaiyya*, their tribal tutelary deity. They speak a patois allied to old Kannara. They are perfect trackers of wild animals. Polygamy is freely practised. Widows are permitted to marry. They live in huts built of bamboo and thatched over with plantain leaves. Each settlement has its own headman who exercises very wide powers. (C. R., 1901; C. T. S. I.)

Sudugadusidda (1,198).—These are found mostly in the districts of the Western Division and Mysore. The chief occupations are begging and cultivation. They are itinerant mendicants. These are considered as allied to the Jogis or Sillekyatas. The name literally means 'lords of the burning ground'; the *Kalaradi* who took the cloth of the deceased and a fee for every dead body burned, formerly paid the members of this caste something as acknowledging their overlordship. (C. R., 1901.)

Tigala (69,233).—Nearly four-fifths of the members of this caste reside in Bangalore (including the Bangalore City and Civil and Military Station, Bangalore) and Tumkur Districts. These are cultivators by profession, market gardening being their speciality. Seven-tenths of the actual workers returned, follow the traditional occupations. The other principal means of livelihood is labour (mining and other). They talk either Kannada or Tamil. Those that talk Kannada are the earliest immigrants among them into the State, and they are found in Tumkur. The two main endogamous divisions are known as *Uti* or Kannada Tigala and Anava Tigala or *Dharmarayana Tigala*. The latter includes the sub-divisions *Tondavarallaru*, *Agamaliyararu*, *Kanjararu*, *Vannigararu* and *Yeli Tigala*. The exogamous divisions are named after deities or founders. A girl is married generally not later than twelve. A woman may remain unmarried. Polygamy is allowed. The bride need not necessarily be younger than the bridegroom. Divorce is allowed. The bride price is a rupee and a half. Marriage of widows is permitted. During the first year of a person's death they perform monthly ceremonies to propitiate the dead. In succeeding years, the whole body of the deceased ancestors are worshipped on the *New-year's day* and the *Muhalya new-moon day*. The Tigalas have divided themselves into sections by the tracts of country inhabited by them, each section called a *Katteru* are being under the jurisdiction of a headman or *Gauda* with a council of elders. Persons from any higher castes may be admitted into the Tigala caste. There are both Saivas and Vaishnavas in the caste. They worship all the Hindu gods; other deities worshipped are—*Motamma*, *Marigamata*, *Mumswata*, *Yellamma*, *Siddeswari*, *Kollapuramma*. During marriage they do *puya* in the name of *Agam Vanku Raja*, their progenitor, burning frankincense. The tribal festival is that of *Kanaga*, which is celebrated with great zeal and ceremony once every year in the month of *Chaitra* and lasts nine days. *Dharmaraya* is the special deity worshipped. (Mys. Eth. Mon.)

- BALUCHI (3).—An immigrant tribe.
- DAYARE (422).—These are found chiefly in the Bangalore District. They differ from the general body of Musalmans in that they believe that the *Imam Mahdi* has visited this earth and departed. They do not intermarry with the other Musalmans. They carry on a brisk trade in silk.
- DHOBI (1).—An immigrant tribe.
- GUJAR.—See *supra* under Hindu castes.
- HANIFI (188).—A Musalman sect.
- JAM (125).—An Asiatic tribe of reputed foreign origin.
- JANJUA (17).—A Musalman tribe of the Punjab.
- JAT.—See *supra* under Hindu castes.
- KHARRAL (2).—A tribe of the Punjab, which counts among its members Hindus, Sikhs and Muhammadans.
- KHADRI (5).—An Asiatic tribe of reputed foreign origin.
- KHAKAR (520).—Found chiefly in Mysore City and Shimoga District. These are allied to the Pindaris.
- KHANDARI (40).—A Musalman territorial name meaning a person from Kandahar.
- LABBAI (7,995).—An immigrant tribe of traders and money-lenders. The Labbais are descendants of Arab and Persian traders who landed on the Coromandel Coast in the 8th Century A. D., owing to persecutions at home. These are found chiefly in the Mysore District. Many speak Tamil.
- MAPILLA (2,257).—These are found chiefly in the Kolar Gold Fields and the districts of the Western Division. They are labourers and traders. These come from Malabar. Malayalam is spoken by many among them.
- MEMAN (661).—This tribe is found chiefly in the Civil and Military Station, Bangalore, and Mysore City. They are mostly traders.
- MUGHAL (8,151).—This is an immigrant tribe from the North and settled in the State for good. They are descendants from Tartar chiefs who followed Tamerlane into India and who came later to take service under Mughal Emperors. They are engaged in service under the Local Government and also in trade and agriculture.
- NAVAYAT (9).—A Musalman tribe which appears to have originally settled at Bhatkal in North Canara. This tribe does not intermarry with other tribes.
- PANJABI (65).—A territorial name meaning a native of the Panjab.
- PATHAN (44,689).—These are found all over the State. They are Musalmans of Afghan descent and long settled in Mysore. The actual workers are found engaged in all the chief occupations returned for the State.
- PERSIAN (63).—A territorial name meaning a native of Persia.
- PINDARI (2,047).—These are found chiefly in the Kolar and Tumkur Districts and Mysore City. They are the descendants of the disbanded soldiers of the Mughal Empire who in the beginning of the last century, ravaged Central India. They are now settled in general occupations.
- PINJARI.—See *supra* under Hindu castes.
- SAIYID (57,671).—The Saiyids are the lineal descendants of the Prophet, being descended from Ali, the son-in-law, and Fatima, the favourite daughter of Mahomet. These claim the first place among the Musalmans by virtue of their pedigree.
- SHEIKH (176,482).—The majority of the Musalman population of the State has been returned under this head. 'Sheikh' properly connotes Musalmans of foreign descent who are the descendants of the first three Khalifas or successors of the Prophet.
- SHARIF (1,037).—A tribal name among Musalmans.
- TURK (4).—A Musalman territorial name.

CHRISTIAN.

ANGLO-INDIAN (5,827).—This term is applied to those who used to be formerly termed Eurasians.

ARMENIAN (1).—A racial designation.

EUROPEAN AND ALLIED RACES (7,492).—The distinction has been made between British subjects (7,123) and others (369). All Europeans etc. whose disciplines are Great Britain or a British Colony or Dependency have been treated in accordance with the instructions of the General Commissioner for India as British subjects unless the contrary was expressly stated.

INDIAN CHRISTIAN (45,554).—Christian Natives of India.

JAIN.

BANIYA (6).—Immigrant traders from the North.

BORA (2).—Do do do

BRAHMAN (6).—Jain Brahman.

CHATURAKSHARI (112).—A division among the Jains who are divided into two orders.

DIGAMBARA (9,665).—A sect among the Jains. The Jains indigenous to the State are Digambaras. These are generally engaged in trade, selling mostly iron and copper vessels, and are scattered over the country, the largest number of them being found in Shimoga, Alwar and Hassan districts. Agriculture is the chief occupation. Succession in the Jain religion is by the sons of the Jains in the State. Marriage takes place before or after puberty. Widows are not allowed to marry. The dead are buried.

SUBSIDIARY TABLES.

I.—CASTES CLASSIFIED ACCORDING TO THEIR TRADITIONAL OCCUPATIONS.

Group and caste	Strength (000's omitted)	Proportion per mille of population	Group and caste	Strength (000's omitted)	Proportion per mille of population

NOTE.—The figures for Komati and Vaisya have been added together for the present Census to compare with the figures for Komati of the previous Censuses. Koracha and Korama being allied castes, the figures for these are added together for purposes of comparison with similar figures since 1871. The figures for Animistic castes returned as Hindus in this Census have been added to the figures for the castes as given in this table.

CHAPTER XII.

OCCUPATIONS.

PART I.—GENERAL.

233. This chapter deals with the occupations of the people of Mysore, distinguishing *Actual Workers* from *Dependants*. Scope of chapter.

234. The statistics of occupations are contained in Table XV, Parts A, B, C and E, and Table XVI; and an explanatory memo as to the nature of information contained in the former is given on the title page of Table XV-A and is extracted below, with modifications, for ready reference. Reference to statistics.

(i) XV-A. In this, the occupations have been arranged in 4 *classes*, 12 *sub-classes*, 55 *orders* and 169 *groups*. For the purpose of this Table, an actual worker is classified according to his principal occupation, and a dependant, by the principal occupation of the actual worker on whom he depends. Thus the same person is not counted twice for purposes of grouping and the population is distributed exhaustively into 169 groups.

(ii) XV-B. In this are given the subsidiary occupations of the agriculturists (actual workers only); and the Table is divided into three parts:—

- (1) Rent-receivers (landlords),
- (2) Rent-payers (actual cultivators) and
- (3) Farm servants and field labourers.

In each part, figures are given separately for some of the most numerous subsidiary occupations followed.

(iii) XV-C. This Table shows for certain mixed occupations the number of persons who returned each as their (a) *principal* and (b) *subsidiary* means of livelihood. Four pairs of occupations have been selected for the purpose, viz., (a) agriculture and government service, (b) village watchman and agricultural labourer, (c) grain dealer and money-lender and (d) landholder and money-lender.

(iv) XV-E. This Table gives the particulars of statistics relating to industrial undertakings in the State, employing not less than 20 persons on the date of the Census. The Table is divided into four parts as follows:—

- I. This gives for the Province as a whole the number of persons employed in each kind of industry dealt with;
- II. This part deals with the details for each district; and
- III. and (4) furnish statistics of the *races* and *castes* of owners and managers of factories, etc.

(N. B.—Table XV-D showing the distribution of occupations by religion was not compiled for the State, the preparation thereof having been left to the option of local Governments.)

In addition to the above, nine Subsidiary Tables compiled for the purpose of presenting in a condensed form the salient features of the statistical details contained in the main Tables and in certain departmental returns are appended to the chapter and their headings are shown below:—

- I. General distribution of the population by occupation;
- II. Distribution by occupation in the two Natural Divisions;
- III. Distribution of the agricultural, industrial, commercial and professional population in Natural Divisions and districts;
- IV. Occupations combined with agriculture (where agriculture is the *subsidiary* occupation);
- V. Occupations combined with agriculture (where agriculture is the *principal* occupation);
- VI. Occupations of females by sub-classes, and selected orders and groups;
- VII. Selected occupations and a comparative view of the figures of 1911 and those of 1901;
- VIII. Occupations of selected castes.
- IX. Apart from the above, a special Table (Subsidiary Table IX) to show the number of employés in the Railway, Post Office, Telegraph and Irrigation Departments, has been also appended.

System of enumeration and nature of information collected.

235. In 1881, the occupations of only such of those as were *actually* engaged in some calling or other were shown in detail, while all the juveniles *under 15 years* of age and all dependants were grouped under one single head 'Unoccupied.'

In 1891, all males and females who earned their living by their work or lived on private property such as house rent, pension, etc., were enumerated as 'actual workers' and in the case of children and women doing no work, the occupation of the head of the family or of the person supporting them was recorded, the word 'dependant' being added against them. In the case of persons following dual occupations, only the principal occupation was entered against them except when the subsidiary occupation was agriculture, in which case the latter was also shown.

In 1901, in addition to such of those as were shown as 'actual workers' in 1891, those also who got work done by others were shown under that head and a record was made of the subsidiary occupations also *in all cases* whether or not connected with land.

On the present occasion, the system of enumeration remained almost the same as in 1901 and three columns were provided in the schedule for recording the occupations of a person as shown in the margin.

Occupation or means of subsistence of actual workers		If dependant, principal occupation or means of livelihood of actual worker on whom dependant
Principal	Subsidiary	
8	9	10

Columns 8 and 9 were intended for the entry of *principal* and *subsidiary* occupations of actual workers, while in column 10 entries were recorded regarding the

occupation or means of subsistence of *actual workers supporting the dependants*.

236. The following instructions were issued to enumerators for filling in the above columns:—

"Before filling up these columns, you should first of all determine by suitable enquiry whether the person about whose particulars you are writing should be treated as *independent* and entered in columns 8 and 9 or as *dependant* and entered in column 10. For example, children who actually do work and earn wages, and women who earn money by occupations in which the husbands do not take part, such as selling firewood, butter-milk, cowdung cakes, or grass or rice pounding, weaving or doing house work for wages, should be shown under those occupations in columns 8 and 9. But women and children who do not carry on any such occupation should be entered in column 10 as *dependants*. Servants are not to be shown as dependant on the occupation of their master.

"In filling up columns 8 and 9, the occupations of *actual workers* should be clearly entered distinguishing carefully the *principal* from the *subsidiary*.

"If a person who has more than one occupation or means of livelihood should express a doubt as to what he should consider as his principal occupation, he should be asked which of the occupations he relies upon most for his livelihood or considers to be the most indispensable, and that should be regarded as his principal occupation and entered in column 8. The rest should be regarded as subsidiary occupations; and of the latter again, that on which he relies the most should be entered in column 9. It is not necessary to enter more than one subsidiary occupation.

"The entries should be made clearly and exactly. Do not use vague terms such as 'service,' 'government service,' 'shop-keeping,' 'trade,' 'writing,' 'labour,' etc., but state the exact service, the goods sold in the shop, the class of articles the person is trading in, the class of writing or labour and so forth. For example, in the case of clerks, domestic servants and the like, the kind of service rendered should be precisely stated and also the occupation of the person to whom it is rendered, as for instance, jahgirdar's cook, schoolmaster's water carrier, lawyer's typist, rice merchant's accountant, etc.

"When a person is in the service of a public body, enter the name of that body before service, thus railway guard, municipal sweeper, etc.

"A seller who makes the articles he sells should be entered as 'maker and seller' of them.

"In the case of agriculture, persons should be entered as—

- | | |
|----------------------------------|------------------------------------|
| (i) Non-cultivating landholders, | } corresponding to rent-receivers. |
| (ii) Non-cultivating tenants, | |
| (iii) Cultivating landholders, | } corresponding to rent-payers. |
| (iv) Cultivating tenants, | |
- and (v) Field labourers—those *generally* employed being clearly distinguished from those who work *by the day or by the job*.

Instructions to enumerators.

"In the case of labourers who are not agricultural labourers, they should be entered as *earth-workers, labourers in mines* (stating the substance mined such as stone, gold, etc.) and *operatives in mills, workshops, factories, etc.*, specifying the kind of mill or factory such as cotton mills, rice mills, lac factories, oil-presses, etc.

"Gardeners and growers of special products such as coffee, cardamom, pepper, betel. etc., should be shown as such separately.

"In the case of one or more members of a joint family who earn money, they should all be regarded as actual workers and their *principal* and *subsidiary* occupations should be entered in the respective columns. They are not to be shown as dependants."

237. The entries of occupations in schedules were generally clear and owing to the simplification of the scheme of occupations (to be described below) and with the use of alphabetical indexes of occupations in English and Kanarese, the mistakes in slip-sorting and compilation were few and unimportant and were promptly corrected on discovery. **Accuracy and limitations of the return.**

Apart from certain mistakes in schedules and in tabulation, the returns of occupations are affected by the facts that the Census is taken on a date when certain occupations like agricultural field labour are at a low ebb and that all the subsidiary occupations of an actual worker are not recorded, only the principal one being taken to account.

238. The scheme of classification of occupations adopted in 1901 divided all occupations returned in the schedules into 8 classes, 24 orders, 79 sub-orders and 520 groups. This classification was open to criticism in several ways. In the first place, it was far too elaborate for Census work in India and involved an excessive amount of labour in compilation. Secondly, the results obtained were in some cases defective. Accordingly the Census Commissioner for India drew up a scheme based on that of Monsieur Bertillon, an eminent European statistician, by which the number of detailed heads in the grouping of occupations was greatly reduced. **Revision of the scheme of occupations.**

239. M. Bertillon's scheme, the great merit of which is its elasticity and applicability to all countries at all stages of economic progress and industrial development and which was commended by the International Statistical Institute for general adoption with a view to rendering possible the comparison of the occupation statistics of different countries, divides all occupations into 4 main classes and 12 sub-classes with 3 series of minor sub-divisions, *viz.*, 61 orders, 206 sub-orders and 499 groups. The 4 main classes and 12 sub-classes are the following:— **M. Bertillon's scheme and the principles underlying it.**

A. Production of raw materials:

- (i) Agriculture.
- (ii) Extraction of minerals.

B. Transformation and employment of raw material:

- (iii) Manufacture.
- (iv) Transportation.
- (v) Trade.

C. Public administration and liberal arts:

- (vi) Public force.
- (vii) Public administration.
- (viii) Liberal professions.
- (ix) Persons living on their income.

D. Miscellaneous:

- (x) Domestic service.
- (xi) Insufficiently described occupations.
- (xii) Unproductive and not returned.

The rationale of the scheme is explained by M. Bertillon thus:—

"These divisions are so logical that there is scarcely need to justify them.

A. Man procures raw materials necessary for every occupation either by working upon the soil (I. Agriculture) or by working under the soil (II. Extraction of minerals).

B. These materials are then changed by the arts and manufactures (III. Manufactures), carried to the place where they are needed (IV. Transportation), and distributed among consumers by trade (V. Trade).

C. To keep good order and guard the welfare of the preceding occupations, every country has an army and a police force (VI. Public force) and a public administration (VII. Public administration). The liberal professions (VIII) and persons living on their income (IX) naturally follow the occupations just reviewed.

D. Finally, it is expedient to establish a division for domestic service (X), insufficiently described occupations (XI) and unproductive (XII)."

The new classification as adopted at the present Census.

240. The scheme adopted on the present occasion maintains unchanged the classes, sub-classes and orders of M. Bertillon's scheme, but the sub-division of the orders into groups has been carried out with reference to local conditions. This classification as further simplified by the Census Commissioner divides all occupations into 4 main classes, 12 sub-classes, 55 orders and 169 groups as against 8 classes, 24 orders, 79 sub-orders and 520 groups in 1901. The distribution of population by classes, sub-classes and orders is given in subsidiary Table I. and the classified scheme of occupations (including groups) is printed as appendix A.

Re-arrangement of the occupation groups of 1901.

241. An English alphabetical index of occupations and a classified list of occupations in Kanarese with their English translations were prepared and referred to in the course of tabulation. By means of these and with the help of appendix II to the Census Commissioner's letter No. 240, dated 17th February 1911, the groups of the last Census were brought under the corresponding groups of the present classification and a comparison has been made possible of the present statistics with those of 1901 as will be seen from Subsidiary Table VII and elsewhere in this chapter. The result thus arrived at is in many cases but a fair approximation and not an absolute accuracy. The fluctuations are in some cases very great, and a comparison of the present figures with those of the previous Census often fails to throw light on the changed condition of the people during the decade 1901-11. But this will be more than compensated by the fact that the Census statistics as now compiled admit of international comparison.

PART II.—URBAN AND RURAL OCCUPATIONS.

Introductory.

242. Before discussing the statistics in detail by different sub-classes, orders and groups, it will be well to pause here for a while and take a general survey of the whole field of occupations under two main heads (i) *Urban* and (ii) *Rural*. Certain occupations are urban in their nature and practically foreign to rural economy, such as mining and other large industrial concerns, public force, public administration, domestic service and the like while others such as agriculture, trade in articles of ordinary home consumption etc., are essentially rural.

Distribution of population by occupation.

243. Subsidiary Table I of this chapter exhibits the general distribution of entire population of the State by classes, sub-classes and orders of occupations. The distribution by sub-classes is graphically illustrated in the following diagram:—

Diagram showing the percentage distribution of the total population of the Mysore State (including Civil and Military Station, Bangalore) by sub-classes of the occupation scheme.

From this diagram, it will be seen that 73·1 per cent of the entire population of the State (including Civil and Military Station, Bangalore), i.e., 4,245,644 persons come under sub-class I—Exploitation of the surface of the earth—and are engaged in different pursuits for the production of raw materials. Of these again, *cultivation* (groups 1 to 6) claims the largest proportion, being 72·4; next comes *pasture* (groups 9 to 12) supporting 0·5 per cent. Under *fishing and hunting* the proportion is extremely small being only 0·04, while the rest, viz., 0·2 per cent, belong to groups 7, 8 and 13 and follow either the order of *forestry* or of *raising of small animals*. Next in the order of relative strength come those who follow *industrial pursuits*. Their proportion to the total population of the State is 7·6 per cent. Of them again 1·8 come under industries of dress and toilet; and textile, metal, and food industries claim 1·7, 0·4 and 0·4 per cent respectively, while the rest of the orders in this class count 3·3 per cent on the entire population.

Sub-class V—Trade—counts 236,104 persons, being 4·1 per cent of the total population. Most of them, viz., 2·5 per cent trade in food stuffs, while a comparatively small number of them, viz., 0·4 per cent, deal in textiles. Next in the order of importance comes sub-class II (Extraction of minerals) supporting 52,987 persons or 0·9 per cent of the total population as against 14,358 or 0·3 per cent in 1901. The large increase under this head is mainly due to the increased prosperity of gold mining and manganese industries in the State during the decennium 1901-11. This subject will be discussed at length later on.

Of the other sub-classes, Transport (IV) supports 0·5 per cent Public force (VI) and Public administration (VII) show 1·2 and 2·3 respectively and Professions and Liberal Arts (VIII) claim 1·4 per cent, and sub-class IX—Persons living on their income—supports 0·4 per cent. Under the remaining three heads, viz., sub-classes X to XII, the percentage on total population is 8·5. Viewed by main classes of the occupation scheme, 74·0 per cent of the entire population are engaged in the Production of raw materials, 12·2 per cent in the Preparation and supply of material substances, 5·3 in Public administration and Professions and liberal arts, the remaining 8·5 being supported by other occupations.

Among the population of the four cities of Bangalore, Mysore, Kolar Gold Fields and Civil and Military Station, Bangalore, Industrial pursuits with 21·5 per cent on the entire population of the four cities, take precedence over all other occupations, as will be seen from the following diagram, Trade, Mining, Domestic service, Exploitation of the surface of the earth, Public force, Professions

Diagram showing the percentage distribution of the population of the four cities of Bangalore, Mysore, Kolar Gold Fields and Civil and Military Station, Bangalore, by sub-classes of the occupation scheme.

and Public administration coming next in order with proportions of 14·1, 12·4, 7·9, 6·7, 6·7, 6·4 and 6·2 respectively. Taking the Province as a whole, it will be seen that agricultural pursuits are mostly rural while in towns the industrial, trading, and mining pursuits preponderate to a considerable extent.

244. The following diagram illustrates the percentage distribution of population of each District and City supported by 5 groups, *viz.*, (i) Agriculture, (ii) Industry (including mines), (iii) Commerce, (iv) Professions and (v) Other pursuits (including Public force and Public administration). On examining the

Diagram showing the percentage distribution of population of each district and city supported by (a) Agriculture, (b) Industry (including mines), (c) Commerce, (d) Profession and (e) 'Other' pursuits including Public force and Public administration.

REFERENCE : —

AGRICULTURE	INDUSTRY (INCLUDING MINES)	COMMERCE	PROFESSIONS & LIBERAL ARTS	OTHERS

figures by districts, it will be seen that the percentage of agricultural population is highest in the Mysore and Hassan Districts, being 80·0 per cent in each, and lowest in Kadur and Chitaldrug (71·7) and (71·6) respectively. The splendid system of river irrigation in the former two districts contributes mainly to this high percentage, while an extensive forest and unculturable area in Kadur, and insufficiency and uneven distribution of rain in Chitaldrug are responsible for the small percentages in those districts. As regards industry, Chitaldrug stands first with a percentage of 11·0 due to the existence of cotton ginning and pressing mills at Davangere and the extensive weaving of woollen blankets carried on in the district. This is followed in the order of precedence by Kolar with 9·0 per cent, Tumkur (7·3), Bangalore (6·9), Mysore (6·1) and Shimoga, Kadur and Hassan with (5·7), (5·5) and (5·4) per cent respectively.

In regard to commerce, Kolar, Bangalore and Chitaldrug take precedence over other districts with a percentage of (4·7), (4·5) and (4·5) respectively, Hassan coming last with only 2·8 per cent.

Professional pursuits claim the highest percentage in the Shimoga District, being 1·3 on the district population while in each of the Bangalore, Kolar, Hassan and Kadur Districts the percentage is 1·2, the smallest percentage being 0·9 in the Mysore District. Under "other pursuits" (including Public force and Public administration) Kadur District occupies the highest place with a percentage of 17·7, Mysore district coming last with only 10·0 per cent.

Turning to the four cities of Bangalore, Mysore, Kolar Gold Fields and Civil and Military Station, Bangalore, the diagram shows that in them the agricultural pursuits are almost eclipsed by the preponderance of industrial and mining occupations, and that next to industry come the orders of Public force and Public administration included under 'others.' Industry (including mines) supports the highest percentage, *viz.*, 84·7 in the Kolar Gold Fields, the percentages in the other cities being 30·4 in Bangalore City, 22·9 in Civil and Military Station, Bangalore, and 18·9 in Mysore City.

The commercial population is lowest in the Kolar Gold Fields, *viz.*, 2·2 per cent and highest in the Mysore City (21·2) per cent, while Civil and Military Station, Bangalore, and Bangalore City show 21·1 and 20·8 per cent respectively.

Under combined group (V)—'others,' comprising Public force, Public administration, Domestic service and other orders—Civil and Military Station, Bangalore, comes first with a percentage of (45·3), next comes Mysore City (37·7), then Bangalore City (36·1), and last of all, Kolar Gold Fields (11·8).

The professional population preponderates mostly in the two capital cities of Bangalore and Mysore, being 7·0 and 9·9 per cent respectively, while Kolar Gold Fields City claims only 0·9 per cent.

245. Comparing the occupations in the districts with those followed in the four cities, it will be seen that the occupations in the cities alone have certain urban characteristics in them while those in districts (including minor municipal towns which are at best but overgrown villages) are practically rural in their nature. Agriculture prevails most in the districts and least in cities, while 'industry,' 'commerce,' 'profession,' 'public force,' 'public administration,' and 'domestic service' preponderate in cities. The large percentage of industrial population in Kolar Gold Fields City is an indication of the increased prosperity of the gold mining industry which has in the decennium 1901-10 received an enormous impetus by the introduction of electricity as motive power in place of steam. In the two capital cities of Bangalore and Mysore, which are the seats of administration, reside most of the Government Officers; and this accounts for a large percentage under 'public force,' 'public administration' and 'domestic service' included in combined group V 'others.' Occupations in cities and in districts compared.

Civil and Military Station, Bangalore, is more a military cantonment than a civil station. It has a large percentage of 45·3 of population supported by military and other services of Government, while 'industry' and 'commerce' with comparatively small percentages under each group take a secondary place.

246. For a correct appreciation of the present agricultural and industrial situation of the people of Mysore, it is necessary to have a clear idea of the rural conditions as they prevail in an average village in the State the population of which we have seen in Chapter I to be 303. A description of village life in Mysore.

Descriptions, more or less detailed from an administrative point of view, of an ordinary Mysore village, will be found in the History of Mysore by Col. Wilkes, in the General Memorandum of 1854 on Mysore by Sir Mark Cubbon and in the Selections from the records of the Commissioner's Office, Mysore, published in 1864.

Conditions have, however, rapidly changed in the interval and the following description is therefore adapted from recent descriptions from an economic point of view such as those given in Mr. P. Banerjee's "A Study of Indian Economics," in the "Economics of British India" by Professor J. Sarkar and in Sir T. Morison's "Industrial Organisation of an Indian Province" and "Economic Transition in India."

(a) "In each of the villages, there is the usual set of village officers, the *patel*, the *shambhog*, the *talari* and one or two more other officials whose duties are laid down by Government. Each village constitutes an industrial unit of which the chief feature is its self-sufficiency. It is, to a large extent, independent of relations with the outside world, so far as its internal economy is concerned; for within its own boundaries the village possesses all the factors which are requisite for the supply of its few wants. The great bulk of the people is agricultural. The cultivators take lease of small plots of the village land either directly from Government or from a landlord to whom they pay rent. They work the land themselves with the aid of their family-members and sometimes also of hired servants. They supply the small capital from their own savings or borrow from the Village economy.

village landlord or the money-lender. They are also themselves the managers, organisers, and experts of their petty farms; and they carry their produce to the market—which is held once in the week—to exchange it for other commodities.

Classes in the village.

(b) "Besides the two classes of landlords and cultivators, there is a third class of inhabitants in the village composed of the artisans. The weaver, the blacksmith, the carpenter, the oilman and the goldsmith supply the needs of the small society, and are recognised members of the village community. The washerman, the barber and the potter are the other artisans of the village. The blacksmith and the carpenter follow industries which are directly subsidiary to agriculture; they make and repair the carts, ploughs and other simple implements of Indian husbandry; the potter supplies domestic utensils; and the barber and washerman perform services for the rural population which Indian social habits have delegated to a particular class of the community. Their services are often paid for in kind. The petty shopkeeper performs the important function of exchanging the different products. The money-lender who also usually combines other functions, especially that of a grain merchant, is by virtue of his position, a very important member. The villagers also have their travelling traders who come to their doors in a definite season every year. The *purohit* and the doctor complete the village organisation.

The economic condition of the village.

(c) "In the village economy, there is very little competition with the outside world though within the village the motive of self-interest prompts everybody to find the best advantage for himself. Wages and profits are to a large extent governed by custom and are comparatively fixed and inelastic. Division of labour is carried to some extent, but as division depends on the extent of the market it cannot be carried very far. Labour is immobile; and what little capital there is in the village is locked up in the land. In short, the village system compels production on a small scale and deepens the effect of custom. Money is rarely used, grain being used for exchange.

Life in the village.

(d) "The different classes in the village are conscious that each is dependant on the others and that the interests of each class are bound up with those of the rest. The villager lives a simple, and in years of good harvest, a contented life. There is little wealth in the village, but the evils of capitalism are also absent. The cultivator or artisan knows little of the comforts and luxuries of urban life and does not miss them.

Change.

(e) "The village system as above described is slowly changing, and the impact of Western civilisation is working a change in the ideas and ideals of the villager. Villages which supply big cities in their neighbourhood or stand on important railway lines are more subject to rapid changes of prices and wages."

Village occupations.

247. The statistics of occupations as ordinarily followed in the rural areas will now be discussed. The subjoined statement gives the proportion per 10,000 of the total population of the State under different kinds of occupations as ordinarily followed in the villages and as distinguished from those pursued in the four cities of the State.

No.	Occupations	Total number of persons supported	Number per 10,000 of population
1	Landlords and tenants	4,028,656	6,939
2	Labourers:—(a) Agricultural	177,372	305
	(b) Labourers unspecified	391,427	674
3	Fishermen and boatmen	3,263	6
4	Stock-owners, milkmen and herdsmen	27,754	48
5	Oil-pressers	6,791	12
6	Toddy drawers and sellers	16,301	28
7	Grain parchers	191	...
8	Leather workers	8,697	15
9	Basket-makers, scavengers and drummers	29,377	50
10	Grocers and confectioners	67,923	117
11	Grain dealers and money-lenders	26,554	46
12	Vegetable and fruit sellers	25,354	44
13	Makers and sellers of bangles	7,669	13
14	Silkworm rearers and silk weavers	2,956	5
15	Cotton workers (not in mills)	32,663	56
16	Goldsmiths and blacksmiths	70,317	121
17	Brass, copper and bell-metal workers	1,691	3
18	Carpenters, wood cutters, etc.	32,149	55
19	Potters	27,060	47
20	Tailors	16,841	29
21	Other shop-keepers	12,314	21
22	Barbers	21,238	37
23	Washermen	44,150	76
24	Doctors, acrobats, etc.	35,122	60
25	Village doctors and midwives	2,876	5
26	Mendicants, etc.	51,979	90
Total		5,168,594	8,902

It will be seen from the above that in every 10,000 persons in the State 8,902 are supported by these village occupations, agriculture claiming 7,244 or 7 in every 10. The other rural occupations all put together support 1,658 persons or 2 in every 10 persons in the State:

The following diagram illustrates graphically the occupations ordinarily followed in a village of the description given in paras 246 and 247. Assuming

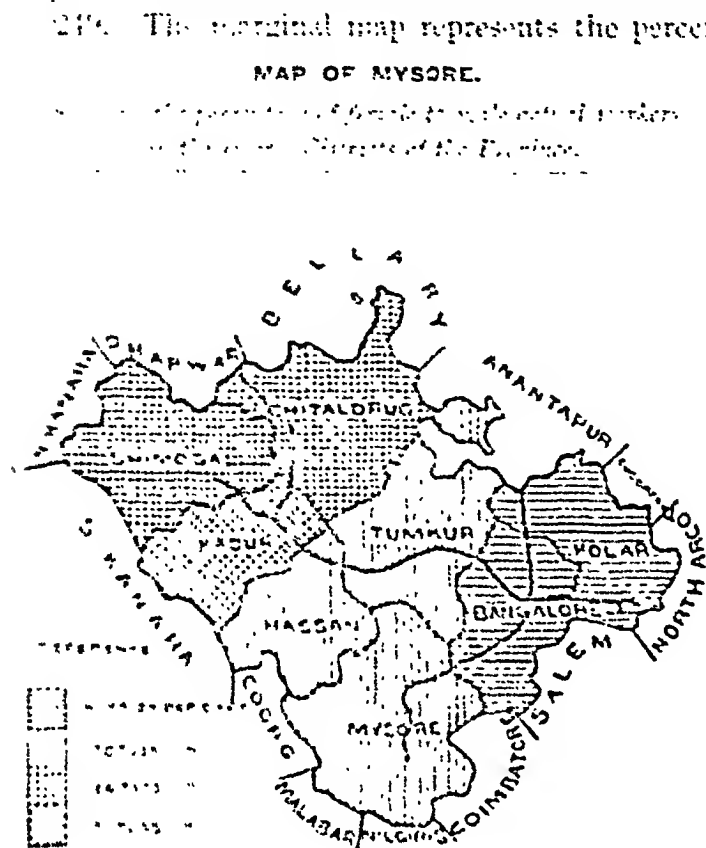

that there are 100 persons in the village, it will be seen that 81 of them subsist mainly by cultivation, field labour and stock-owning; 12 are village artisans and general labourers; 3 are traders and 4 follow miscellaneous pursuits. On further analysing these main occupational groups, it is found that the first division contains 3 non-cultivating landholders, 61 cultivating landholders, 13 land tenants and 4 stock-owners and field labourers. The artisan group which forms 12 per cent of the village population comprises goldsmiths, blacksmiths, carpenters, potters, barbers, washermen and oilpressers; and it also includes a handful of general labourers who assist in one or other of the above handicrafts, and are remunerated in kind or cash according to custom. The third group of traders is made up of grain dealers and money-lenders, shop-keepers, dealers in bangles, etc., vegetable and fruit sellers and the like. The miscellaneous or the last group comprises priests, cotton workers (not in mills), fishermen and boatmen, toddy drawers, grain parchers, basket-makers, leather workers and the village scavengers and drummers. Thus from an economic point of view it may be remarked that the inhabitants of a large village form within themselves a compact, organised and self-sufficient community.

248. The marginal statement worked out from Subsidiary Table I shows the Actual proportion per cent of actual workers to dependants under each sub-class of the occupation scheme. The percentage of dependants to workers is highest in sub-class VII—Public administration—being 76 per cent, and least in sub-class XI—Insufficiently described occupations—and XII—Unproductive—(43 per cent in each). Next to sub-class VII come in the order of precedence sub-class I—Exploitation of the surface of the earth—

Sub-class	Proportion per cent	
	Workers	Dependants
I. Exploitation of the surface of the earth...	27	73
II. Extraction of minerals ...	40	60
III. Industrial occupation ...	35	65
IV. Transport ...	39	61
V. Trade ...	37	63
VI. Public force ...	39	61
VII. Public administration ...	24	76
VIII. Professions and liberal arts ...	32	68
IX. Persons living on their income ...	32	68
X. Domestic service ...	53	47
XI. Insufficiently described occupations ...	57	43
XII. Unproductive ...	57	43
All occupations ...	40	60

(75 per cent), and class VIII—Professions and liberal arts—(68 per cent). IX—Persons living on their income—(68 per cent). III—Industrial occupations—(65 per cent). V—Trade—(63 per cent). VI—Public force—(61 per cent). IV—Transport—(61 per cent). and II—Extraction of minerals—with a percentage of 60.

Proportion of female to male actual workers.

Taking the two sexes separately, 49.4 per cent of males and 12.2 per cent of females are actual workers in the State. The variation per cent by districts

four-grinding, the selling of milk, butter, ghee, poultry and eggs, selling hay, grass and fodder and trade in refuse matter, involve a comparatively small amount of physical labour, the more difficult pursuits being left to the male workers.

PART III--A REVIEW OF THE STATISTICS BY PRINCIPAL ORDERS AND GROUPS.

250. The figures as presented by the general occupation Tables will next be examined for the principal orders and groups.

The marginal table shows the general distribution, per 1,000 of total

Group No.	Occupation	Number supported per 1,000 of total population
1	Income from rent of agricultural land ...	30
2	Ordinary cultivators ...	656
3	Agents, Managers, of landed estates (not Planters), clerks, rent collectors, etc.
4	Farm servants and field labourers ...	30
5	Tea, coffee, etc., plantations ...	4
6	Fruit, flowers, vegetables, betel, vine, areca-nut, etc., growers.	4
	Total ...	724

population, of the agriculturists supported by groups 1 to 6. In the whole State agriculture is the mainstay of 724 persons per mille of total population. Viewed by districts as given in Subsidiary Table III, the proportion of agricultural population per 1,000 of the district population is highest in the Hassan and Mysore Districts, being 801

Agriculture: Sub-class I.
Order 1 (a) and (b), groups 1 to 6.

and 800 respectively; next comes Tumkur (769). This is followed by Bangalore District (762), Shimoga District (740), Kolar District (729), Kadur District (717) and lastly Chitaldrug (715). The distribution of the agricultural population per 1,000 of the total population in the two Natural Divisions gives 759 for the Western Division and 729 for the Eastern Division.

251. This large millage of the agricultural on the total population of the State is mainly due to the inclusion in that category of persons who while following also other occupations such as Government service, etc., as their subsidiary pursuits depend *principally* on agriculture (*vide* para 253 below analysing Imperial Table XV-B).

Occupations combined with agriculture.

252. From the marginal statement and from Subsidiary Table IV, it will be

Sub-class	Number per mille who are partially agriculturists
VII. Public administration ...	437
VIII. Professions ...	187
VI. Public force ...	145
III. Industrial occupation ...	125
IX. Persons living on their income ...	114
V. Trade ...	81
II. Extraction of minerals ...	59
IV. Transport ...	57
XII. Unproductive ...	23
X. Domestic service ...	12
XI. Insufficiently described occupations ...	8

seen that the millage of partial agriculturists is highest in sub-class VII "Public administration" and least in sub-classes X and XI "Domestic service" and "Insufficiently described occupations" with a millage of only 12 and 8 respectively.

(a). Where agriculture is the subsidiary occupation.

An examination of the figures by Natural Divisions as given in Subsidiary Table III to this chapter shows that the agriculturists preponderate in the Western Division. The reason is not far to seek. Nature is more bountiful with copious rainfall in the Western Division and consequently the districts comprising this division are more agricultural; while the fitful and uneven distribution of rain and constant relinquishments of land in the districts comprising the Eastern Division are mainly answerable for the smaller proportions noticed in that division.

253. The statistics of persons following agriculture as their principal means of livelihood are contained in Table XV-B. The main features of these statistics are brought out in Subsidiary Table II appended to this chapter under three distinct categories of (1) landlords (rent-receivers), (2) cultivators (rent-payers) and (3) farm servants and field labourers. Of the landlords or rent-receivers, 1,841 in every 10,000 follow Government service as their subsidiary occupation and 1,534 subsist partly by trade. They are seen in the least proportion as lawyers.

(b) Where agriculture is the principal occupation.

Next, of the cultivating agriculturists (rent-payers), 1,306 in 10,000 live partly by trade, and next to trade, village service (as watchmen), general labour and Government service partially support 1,107, 1,020 and 908 respectively. Thus these Tables (Imperial Table XV-B and Subsidiary Table II) illustrate by figures the significance of the statement in para 246(c) regarding the rural economy in Mysore that "division of labour cannot be carried very far" and the truth of the statement in the Mysore Census Report of 1901 (para 7 of Chapter IX) that "the rural inhabitants combine in themselves the artisan, the raiyat, the labourer and sometimes the trader too." Agriculture is combined in least proportion with fishing and boating.

Among farm servants and field labourers, general labour is the Subsidiary occupation of 2,005 persons, while village service (as watchmen) partly supports 1,350 in every 10,000. Only 3 in 10,000 are both agriculturists and oil-pressers.

Variation of agricultural population in decennium 1901-11.

254. There were 4,206,095 persons returned as agriculturists at the present

Group No.	Occupation	No. supported per 1,000 of total population	
		1911	1901
1	Income from rent of agricultural land	30	488
2	Ordinary cultivators	656	94
3	Agents, managers of landed estates (not planters), clerks, rent collectors, etc.
4	Farm servants and field labourers	30	64
5	Tea, coffee, cinchona and indigo plantations	4	5
6	Fruit, flower, vegetable, betel, vine, arecanut, etc., growers	4	8
	Total	724	659

Census as against 3,653,840 in 1901, the number per mille of total population being 724 and 659 respectively. The variation under the different groups is given in the marginal statement. There is a net increase of 15·1 per cent in the total agricultural population during the decennium; and this is partly attributable to the increase in the area of occupied land in 1911 over that of 1901, being 42·9 as against 40·5 per cent of the net provincial area.

Comparing the statistics of the agricultural population of 1911 with those of 1901 by groups, we find that there is a large increase of 562 per mille in group 2—ordinary cultivators,—while there is a corresponding decrease of 458 per mille in group 1 of 1911, *income from rent of agricultural land*. These variations are due to the present system of classification by which the old groups of 1901 had to be either split up or combined so as to fit them in to the new groups of 1911. An analysis of the figures in group 36 of 1901 shows that this group included the non-cultivating as well as the cultivating landholders numbering in all 2,705,208 persons returned as *landholders* and *rent receivers*. Among these 342,231 were non-cultivating landholders (landholders 329,909, inamdars 1,891, and jodidars 10,431) and the rest, *viz.*, 2,362,977, were simple landholders who both held and cultivated their lands. On the present occasion the non-cultivating landholders alone are retained in group 1, the cultivating landholders being brought under group 2, thus swelling the number in that group. Again, group 37 of 1901—*rent payers*—comprised mostly the tenants only, both cultivating and non-cultivating, and showed a return of 520,213 persons; while group 2 of 1911, which corresponds to group 37 of 1901, has 3,811,562 persons, 3,148,294 of whom are cultivating landholders and the rest, *viz.*, 663,268 are cultivating tenants. The large addition to group 2 of 1911 is thus due to the fact that most of the cultivating landholders who were included in group 36 of 1901 have come to be included in new group 2 of 1911. For purposes of comparison the groups may be arranged thus, the equivalence of the groups for the two Censuses being approximate:—

1911.	1901.
Group 1 (a) Non-cultivating land holders 159,103.	Group 36 (b), Landholders, inamdars, and jodidars, 342,231.
Group 1 (b) and 2 (b) Cultivating and Non-cultivating tenants, 675,714.	Group 37 (a), (b) and (c) Rent payers, 520,213.
Group 2 (a) Cultivating landholders 3,148,294.	Group 36 (a), Hiduvalidars, pattadars, khatedars, vargadars, 2,362,977.

From this it will be seen that the increase in the number of persons in each of the groups "landholders" and "tenants" is proportional to the increase in the

area of occupied land noticed already and to the general growth of population during the decennium 1901-11.

There is also a marked decrease of 34 per mille in group 4—Farm servants and field labourers. There were 353,436 persons who returned themselves as farm servants and field labourers in 1901 (groups 38 and 39 of 1901): but this number consisted of 78,096 *Kumki Zirayatdars* and 131,340 cultivators, some of whom require to be properly classed as cultivating landholders inasmuch as most of them have shares in land and assist in the cultivation of it. Excluding these for purposes of comparison, there will remain in groups 38 and 39 of 1901, 419 farm servants, 113,849 *sagavalidars* and 29,732 field labourers receiving annual payment in kind or money as remuneration for their labour, making a total of 144,000 agricultural labourers as against 177,372 in 1911.

From the above review of the statistics of agricultural population in the State, it may be remarked that the fluctuations by groups are but apparent and not real. As remarked in para 100 of Chapter IX of the Mysore Census Report of 1901, "the expressions recorded in the Schedules of 1901 to denote the agricultural occupations were so vague that it was hard to make out whether a person returning himself as an agriculturist was a cultivating occupant or a non-cultivating occupant, a rent-payer or a rent-receiver and if both, which more and which less or whether he was merely a labourer working in the fields." On the present occasion these distinctions were carefully brought out in the schedules and the fluctuations in the figures of 1911 as compared with those of 1901 are mostly due to the present system of enumeration. They are not to be taken as indicating any material change in the conditions of the agricultural section of the population of the State. Taking all the groups together, it is satisfactory to note that agriculture has made a steady progress during the decennium 1901-11.

255. We have in paragraphs 250 to 254 discussed the statistics relating to the agricultural population of the State who depend mainly and *directly* on the cultivation of land for their subsistence. In addition to these, there is another section

Quasi-agricultural occupations: pasture, sub-class (1), Order i (d), Groups 9-12.

Group No.	Occupation	Actual No.	No. supported per 10,000 of population
9	Cattle and buffalo breeders and keepers ...	875	2
10	Sheep, goat and pig breeders ...	1,091	2
11	Breeders of other animals such as horses, mules, camels, asses, etc.	221	...
12	Herdsmen, shepherds, goatherds, etc.	25,575	41
	Total ..	27,762	48

of the population who subsist *indirectly* on land and who require to be dealt with here as a quasi-agricultural class. They are by occupation Keepers and breeders of cattle, sheep, goats, etc., and live by pasturage. Their number per 10,000 of the total population is 48 and are distributed among the different groups of the occupation scheme as shown in the margin.

256. At the Census of 1901 no distinction was kept up between stock-breeding and dealing, and consequently all persons returning themselves as either breeders or dealers of cattle, buffalo, etc., or in any way connected with stock-owning were shown in one or other of the eleven groups provided at that Census under sub-orders 'Stock-breeding and dealing' and 'Training and care of animals.' Such persons as kept cattle and subsisted by selling milk, butter, etc., were not included among the above but were relegated to a different group provided under 'Provision of animal food.' On the present occasion the stock-breeders are well differentiated from *dealers*: and for purposes of instituting a comparison of the present figures with those of 1901 some of the old groups have been broken up with reference to local conditions on the assumption that the proportions in each part of the group were the same in 1901 as on the present occasion. The result thus obtained is but a rough approximation. In this way most of the groups of 1901 corresponding to groups 9 to 12 of 1911 and comprising the order 'Raising of farmstock' have been split up and the population distributed proportionally, the new groups 9 to 12 receiving some, the rest being added to groups 118, 123, or 129 according as the proportion for splitting the figures in the old groups demanded. For instance, group 78 of 1901 comprising 14,240 persons was made up of 'cow and buffalo keepers' and 'milk and butter sellers.' This number has been broken up in the ratio of the present absolute figures in groups

Comparison of present figures with those of 1901.

9 and 118, viz., 875 and 8,265, which gives 1,365 for group 9 'cattle and buffalo breeders and keepers,' and the rest 12,875 to an altogether different group 118 'sellers of milk, butter, ghee, etc.' Thus, the total number of breeders and keepers of cattle, buffalo, sheep, goat, etc., including all the herdsmen, shepherds and goatherds, supported by order 1 (d) of 1911 'Raising of farmstock' is 27,754 in 1911 according to the new grouping as against 77,431 in 1901. The net decrease of 64·2 per cent is merely due to the somewhat arbitrary adjustment of figures as explained above necessitated for purposes of maintaining a clear distinction between a dealer and a breeder in stock and as such the variation is no indication of any material change which might have taken place in the condition of stock-owners since 1901.

Fishing and hunting: sub-class I, Order ii, groups 14 and 15.

257. Fishing and hunting are mainly rural occupations supporting 2,209 persons or 4 in every 10,000 of the total population as against 5 in 1901. Only 5 per cent of actual workers among fishermen and huntsmen live in cities (Subsidiary Table I).

Extraction of minerals: sub-class II, Orders iii to v, groups 16 to 20.

258. Sub-class II—Extraction of minerals, supports 52,987 persons, or 9 per mille of total population who are distributed among groups 16 to 20 of Orders 3 to 5 of the Occupation Scheme. There are only 3 persons returned under coal-mines and petroleum wells (group 16); and they are all dependants found in Civil and Military Station, Bangalore; group 20—Extraction of saltpetre, etc., has none at all returned under it. Group 18—Other minerals, is a minor group of Order 4, Quarries of hard rocks, and only 28 persons have returned themselves under it. Group 19—Extraction of earth or marsh-salt, is the means of support of 2,136 persons in the State which gives 4 persons in every 10,000 of the population. Of these, 1,657 persons are concentrated in the Chitaldrug District. In 1901, 7 per 10,000 of the total population were supported by this occupation as against 4 on the present occasion. The decline in the number of professional salt workers is chiefly due to the fact that the country earth-salt has failed to find the demand which it did formerly, the cheap sea-salt having taken its place and diverted 98 per cent of the Uppara caste to other walks of life.

Mining industry.

259. Mining is an important industry in the State which yielded a revenue to Government of about 18 lakhs in 1910-11; and before proceeding to discuss the Census statistics relating to this branch of occupation, it will be convenient to take here a general view of the Mining industry in the State as it stood in 1910-11 and as it was at the commencement of the decade.

Gold mines.

260. In 1901, the Kolar Gold Fields City was the chief mining centre. There were 14 mines at work, 5 of which were paying dividends to shareholders. The value of gold produced was £1,921,570 and the royalty paid to Government amounted to £93,912. In 1910-11, the number of gold mines at work was 10. The total value of gold produced in 1910-11 was £2,098,916 and the royalty paid to Government amounted to £118,685, being an increase of £177,346 and £24,773 in the value of gold and royalty respectively over those of 1901.

Manganese and Chromium.

261. Till 1903, gold was the only metal mined in the State. In 1904, Russia which enjoyed with Brazil the complete monopoly of manganese trade was involved in a war with Japan, with the result that Russia had to stop for some time her supply of manganese to the markets of Europe. The supply of the ore having thus become unequal to meet the growing demand, there was a sudden rise in the price of this ore. In some parts of India, operations were commenced for the collection of the ore. Mysore also shared in this and some companies started work in that year. Several promising outcrops of manganese ores were located in the jungles on the Shankargudda Range, south of Ayanur in the Shimoga District, in addition to the discovery of such deposits near Kumsi. In 1905-06, some attention was paid to the collection of chromium also.

The manganese trade continued to prosper till the end of 1906. On the close of the Russo-Japanese war in August 1905, Russia recommenced its operations in manganese with the result that there was a heavy fall in the price of this mineral. Since 1907-08, the Mysore manganese industries began to show

a gradual decline and at the close of 1910 the three manganese companies of Shimoga continued their work in a rather depressed condition while trade in chrome was at a complete standstill.

262. It is, however, noteworthy that several mica deposits in the Sringeri Mica. Jahgir were opened up in 1910-11 and a quantity of 60,000 lbs. of muscovite mica of a fairly good quality was unearthed.

263. We will now proceed to review the Census statistics relating to group 17 of the Occupation scheme—mines and metallic minerals. Census statistics of mining occupation in Mysore.

According to Table XV-A, there were 50,820 persons on the 10th March 1911 supported by mining, being 87 per 10,000 of the total population of the State. 75 per cent of these are chiefly centred in the Kolar Gold Fields City, and of the remaining 25 per cent Kolar District contains 23 per cent and Shimoga District 2 per cent. Both in the Kolar Gold Fields and in the Kolar District 40 per cent are actual workers, 38 per cent being males and 2 per cent females. In Shimoga the proportion of actual workers employed on the manganese mines to the total mining population of the district is 54 per cent, 37 per cent being males and 17 per cent females.

in para 234 of this chapter. It will be therefore convenient to discuss the statistics of industrial occupations under two separate and distinct heads (1) statistics *general* and (2) statistics *special*.

Statistics
General:
Popula-
tion Cen-
sus.

206. As already noticed in para 243 of this chapter, sub-class III—Industrial Occupation, comes next to sub-class I—Agriculture, in the order of numerical strength as well as in importance, supporting 764 persons in every 10,000 of the total population. Their distribution by orders is given in the marginal statement. Of the 764 persons, 177 are supported by the dress and the toilet industries. Textiles, industries of luxury, building industries, wood and ceramics come next in the order of numerical strength, employing 175, 92, 84, 70 and 46 respectively, the remaining orders, all put together, claiming the rest 120.

Order	Occupation	Number supported per 10,000 of total population
	Total	764
6	Textiles	175
7	Hides, skins, etc.	7
8	Wood	70
9	Metals	10
10	Ceramics	16
11	Chemical products	12
12	Food industries	10
13	Industries of dress and toilet	177
14	Furniture industries	1
15	Building industries	84
16	Construction of means of transport	2
17	Production and transmission of physical force	2
18	Industries of luxury	32
19	Industries concerned with refuse matter	16

The number per mille of total population in the State supported by the industrial occupations is 80 in the Eastern Division and 55 in the Western Division (Subsidiary Table II).

District and City	Percentage of industrial population to total population of the district or city	Percentage of actual workers on total industrial population of the district or city	Percentage of male and female workers to 100 workers of both sexes	
			Males	Females
Bellary District	7	31	85	15
Kolar District	7	50	87	13
Tumkur District	7	35	81	16
Mysore District	6	36	78	22
Chitaldrug District	11	30	85	15
Hassan District	5	35	81	19
Kadur District	5	16	76	24
Salem District	6	12	81	19
Bangalore City	30	39	83	17
Kolar Gold Fields	6	52	83	17
Mysore City	19	11	68	32
Civil and Military Station, Bangalore	23	10	80	20
Mysore State including Civil and Military Station, Bangalore	8	35	82	18

will be seen from the marginal statement. Civil and Military Station, Bangalore, has 23 per cent. It is in these two cities that most of the big industrial factories are located. Next comes Mysore City with 19 per cent. Of the districts, Chitaldrug scores 11 per cent, due to the location of cotton ginning and pressing mills at Davangere, while Hassan and Kadur Districts have the least percentages.

Among persons supported by the Industrial occupations in the State, 35 per cent are actual workers and the rest dependants. Kolar Gold Fields City has the highest percentage of actual workers (52) and the districts of Kolar and Chitaldrug, the least (30 each). In the State as a whole in every 100 workers, 82 are males and the rest females.

contained in parts I to IV of Table XV-E. Part I is the Provincial Summary which shows for the Province as a whole the number of persons employed in each kind of industry dealt with, distinguishing between those factories, etc., in which mechanical power is used and those in which it is not, and classifying them according to the number of persons employed. Part II gives for each district the number of persons employed in each industry, without the above details. Parts III and IV are intended to throw light on the extent to which the different races and castes have taken part in the establishment or management of the various industrial undertakings. They are compiled only for certain selected industries.

According to the Provincial Summary the total number of persons employed in factories, mills, works, etc., including gold and manganese mines and coffee, cardamom and rubber plantations is 58,613, of whom 45,382 or 77 per cent are males and 13,231 or 23 per cent females. All the workers are divided into three groups. The first group consists of the superior staff employed in direction, supervision and clerical work. The second is made up of skilled workmen, and the third group consists of unskilled labourers, the latter being again subdivided into two sub-groups—(a) those whose age is 14 and over and (b) those under 14 years. The distribution per cent of the employes in each group is graphically illustrated in the following diagram, from which it will be seen that the percentage on the industrial population of persons employed in direction, supervision and clerical work is 3.7. The skilled and unskilled labourers number 17.1 per

Diagram showing the proportion per cent of the different classes of workmen employed in the various industrial undertakings (employing not less than 20 persons) in the Mysore State including Civil and Military Station, Bangalore.

cent and 79.2 per cent respectively and among the latter 70.4 per cent are of age 14 and over, the rest 8.8 per cent being under 14. The proportion per cent of Europeans and Anglo-Indians to Indians employed in the superior staff of direction and supervision is 33.6. Among the skilled workmen 5 in every 100 are Europeans and Anglo-Indians and the remaining 95 Indians. Of the unskilled workmen 11.1 per cent are juveniles under 14 years of age, the rest being above that age.

The distribution per mille of the labour force employed on the different kinds

Sub-class	Order No.	Occupation	Number supported per 1,000 of the factory population.
I	1 (b)	Growing of special products (242 coffee, 9 cardamom, and 3 rubber plantations).	446
II	3	Mines (6 gold and 3 manganese mines).	441
III	6 to 19	Industrial occupation ...	113

of factory, etc., works in the State (including Civil and Military Station, Bangalore) by sub-classes of the Occupation scheme is given in the marginal statement. It will be seen from it that the big **industrial works**

included in sub-class III support 113 per mille of the factory employees, the rest being employed by the coffee plantations of Kadur and Hassan Districts and by the gold mines of Kolar and manganese mines of Shimoga. Among the factory works, those connected with the textiles take precedence over the rest and employ 39 per mille.

**Power
employed
and state
of busi-
ness.**

269. Of the 327 factory works in the State, mechanical power is used in 80 works, water being employed in 19, oil in 14, steam in 29, electricity in 12 and steam and electricity in 6. As regards the state of business on the 10th March 1911, it was much brisker than usual in 4, brisker than usual in 30, somewhat brisker than usual in 29, normal in 178, somewhat slacker than usual in 18, slacker than usual in 38 and much slacker than usual in 30.

Kolar is the only gold-producing district. The woollen and cotton spinning and weaving mills are located in the City of Bangalore, the former using electricity and the latter steam. The cotton ginning and pressing mills which use steam power are located at Davangere in the only cotton-growing district of Chitaldrug. The hydro-electric plant is installed in the Mysore District at the Cauvery Falls in Sivasamudram. Kadur and Hassan are coffee-growing districts, the former containing 163 coffee plantations employing 18,002 labourers and the latter 77 plantations with 6,433 workmen. In Shimoga District, there are 3 manganese mines giving employment to 538 persons.

**Owner-
ship of
factories.**

270. For purposes of Parts III and IV of Table XV-E, 315 factories have been selected. 58 of these are owned by companies and the remaining 257 by private persons. Of the former 40 employ European or Anglo-Indian directors and 17 Indians, while in 1 they are of both races. Of the 257 private factories, etc., Europeans and Anglo-Indians own 138, Hindus 67, Musalmans 28, Indian Christians 21, Jain 1, Parsi 1 and Jew 1. Again, of the Hindus, 16 are Brahmans, 1 Devanga, 9 Komatis, 20 Lingayats, 20 Vakkaligas, and 1 Mudali.

**Caste or
race of
managers.**

271. Of the above 315 works and factories, 186 are managed by Europeans or Anglo-Indians and 129 by Indians. Of the Indians, 75 are Hindus, 27 Musalmans, 23 Indian Christians, 2 Jains, 1 Parsi, and 1 Jew; and among the Hindu managers, again, 25 are Brahmans, 20 Lingayats, 19 Vakkaligas, 8 Komatis, 2 Mudalis and 1 Devanga.

A comparison of the special industrial figures with those of the general Census under sub-class III of the Occupation Scheme shows that 15 in every 1,000 persons are factory employés.

The statistics reviewed till now have a peculiar value as throwing light on the industrial expansion of the State in recent times.

**Hydro-
Electric
Works or
'the
Cauvery
Power
Scheme.'**

272. Before closing the section on the industries in Mysore, a short description may be given of the Cauvery Electrical Power Scheme which supplies power to the mining industry and has begun to affect the internal structure of other industries in the State. The works connected with the Electrical Department in the Province have been grouped under the head "Production and transmission of physical forces." These are of recent origin and did not exist in the previous decade. The main power station is located at Sivasamudram, where, the river Cauvery, as it passes out of Mysore, branches into two streams, each making a descent of about 200 feet in a succession of picturesque rapids and waterfalls. Here at the western falls which present a scene of grandeur and beauty are installed the Hydro-electric Works, better known as the Cauvery Power Scheme, which has been designed to generate electricity for the supply of power to the Gold Fields of Kolar as also to the three chief cities in the Province for lighting purposes.

Its history.

(a) In June 1899, it was decided to utilise the falls for generating electricity and to work with it the gold mines of Kolar. Accordingly, a special division known as the Cauvery Power Scheme Division was formed and the headquarters were established on the 'Bluff,' immediately above the site of the Fore-bay and Power Station. Steady progress in the construction work was made both at Sivasamudram and at Kolar Gold Fields; and in June 1902, the operations were in readiness for a final test. On the 30th June of that year, the electric power

was for the first time successfully transmitted to the Gold Fields, and since then the transmission has been steadily kept up uninterrupted.

The whole scheme was completed on the eve of the Installation on the 8th August 1902, of His Highness Sri Krishnarajendra Wodeyar Bahadur when he was invested with the administration of the State. The main power station has been named after Sir Sheshadri Iyer.

A second installation for an additional 2,000 H.P. was completed in January 1905 at a cost of 13 lakhs, and a third was started in 1906 and completed in 1908.

(b) The Electric Works as they stood in 1910-11 consisted of 5 electric power and light works and 1 hydro-electric plant, the former for the supply of power to the Cities of Bangalore, Mysore, and Civil and Military Station, Bangalore, for lighting purposes, and the latter for the supply of power to the Kolar Gold Fields. The total number of persons employed on these works was 391 on the date of the Census. The number of street lights at the close of 1910-11 was 2,832. Of these, 1,325 were in the Bangalore City, 598 in the Mysore City and 909 in the Civil and Military Station, Bangalore. In addition to these, there were 603 interior lighting installations and 20 power installations (11 in Bangalore City, 4 in Mysore City, 4 in Civil and Military Station, Bangalore and 1 in Kolar Gold Fields). The total quantity of power generated in 1910-11 amounted to 74,776,308 units. Of these, 69,795,028 units were sold to the Kolar Gold Fields; and of the remaining power 2,868,809 units were supplied to Bangalore City, 1,353,280 to Mysore City and 759,191 to Civil and Military Station, Bangalore, for lighting purposes.

Net result of the scheme.

The revenue actually collected during the year 1910-11 amounted to Rs. 1,599,179, leaving an arrear at the end of the year of Rs. 281,249.

The total capital outlay invested on the scheme since its commencement up to the end of June 1911 amounted to Rs. 8,261,696 and the gross earnings from the scheme amounted to Rs. 14,378,051. Deducting the working expenses, the net profit on the whole scheme till the close of 1910-11 amounted to Rs. 7,368,876, which represents 89.19 per cent of the capital outlay.

273. Now turning to sub-class IV—Transport, we see that on the present occasion 31,096 persons or 53 in every 10,000 of the total population of the State are supported by this sub-class, as against 33,515 or 60 per 10,000 in 1901, the decrease being due to the proportional splitting up of the figures in the old groups of 1901 to correspond with the figures in the new groups of 1911.

Transport Sub-class iv.

Their distribution among the four orders of the Occupation Scheme gives for every 10,000 of the total population 1 to order 20—Transport by Water, 30 to order 21—Transport by road, 16 to order 22—Transport by Rail and 6 to order 23—Post Office, Telegraph and Telephone Services.

39 per cent of the population maintained by this sub-class are actual workers and the rest dependants (Subsidiary Table I).

274. This order comprises 594 persons employed on the maintenance of streams, rivers, and canals (including construction) and of boat-owners and 2 persons included in groups 94 and 95—Harbour works and Ship employes, who are found in the Civil and Military Station, Bangalore, as dependants. The former are found chiefly in the river districts of Mysore (including Mysore City) and Hassan. In every 100 persons in the State, 52 are in the Mysore District, 16 in Hassan, 9 in Kadur, 7 in each of the districts of Chitaldrug and Tumkur and 4 in each of the districts of Shimoga and Kolar. Bangalore comes last with the least percentage of 1.

Transport by water Order 20.

275. The number supported by this order in the State including Civil and Military Station, Bangalore, is 17,547 in 1911 as against 21,394 in 1901. The difference is due to the adjustment of figures according to the new classification. The number supported by this order per 10,000 of the total population is 30, of whom 13 are actual workers. They are spread over groups 98 to 102 of the Occupation scheme and consist of persons employed on the construction and maintenance of roads and bridges, cart-owners and drivers, jutka drivers and owners, coachmen and stable-boys, owners and drivers of pack animals such as mules, bullocks, etc.,

Transport by road Order 21.

and porters and messengers, etc. Their distribution per cent by district and city in the order of numerical strength is noted in the margin. Among the four cities, Civil and Military Station, Bangalore, comes first with a percentage of 17 followed by Bangalore City with 10 per cent. The high percentage in these two cities is due to the large number of cart-owners, drivers, coachmen, etc., who reside in them, a feature which one may readily notice at the Railway stations in these places. Perhaps, the very first thing to arrest the attention

of a stranger alighting here is the presence of a large number of private and hackney coaches and the long line of jutkas and bullock carts the drivers of which flock close to the platform. Incidental to the heavy transport is the maintenance of a number of roads, and this gives employment to several persons who have been included in group 98 of this sub-class.

Transport
by Rail:
Order 32.

276. The total number supported by this order is 9,395 or 16 per 10,000 of the

District and City	Percentage
Total	100
Bangalore District	12
Bellary District	5
Talashree District	5
Mysore District	4
Channarayana District	3

Bangalore City	27
Mysore City	1
Bellary City	5
Civil and Military Station, Bangalore	13

total population, of whom 6 are actual workers and the rest dependants. Their percentage distribution by districts and cities is given in the margin. Among the districts the percentage is highest in Bangalore (12) and least in Shimoga (2); while among cities, the Bangalore City contains the largest percentage of 27 and Mysore City the least (1).

Post office,
etc.,
services
Order 23.
Trade:
sub-class
v.

277. Six per 10,000 of the total population are supported by this order, 2, of whom are actual workers. Viewed by districts, their proportion is highest in the Mysore District (12 per cent) and least in the Hassan and Tumkur Districts (7 per cent in each). Among cities, Civil and Military Station, Bangalore, has the largest proportion of 20 per cent, and Kolar Gold Fields least (1 per cent).

The distribution by districts of the trading population is given in the marginal map. It will be seen from it that Bangalore District has the highest milleage of 65. Next come in order, the districts of Kolar, Chitaldrug and Shimoga with milleages of 41, 41 and 40 respectively. These are followed by Mysore District (36), Tumkur (34) and Kadur (33). Hassan District is the least commercial, the trading population in it being 25 per mille. The high milleage in the Bangalore District is due to the inclusion in it of Bangalore City and Civil and Military Station, Bangalore, which are the chief trading centres in the Province.

MAP OF MYSORE.

Showing the milleage distribution of the trading population in the several districts.

279. In 1901 there were 278,772 persons or 50 per mille returned under trade as against 236,104 or 41 per mille in 1911. In 1901 the distinction between "makers" and "sellers" was not uniformly kept up. But on the present occasion, this distinction between a *maker* and a *seller* has been clearly kept up. Persons who *make* are in all cases classed under "Industry" whether they sell the articles to middlemen or direct to the consumer, while persons who *sell* only and do not *make* are classed under "Trade." This distinction accounts for the variations in some of the groups included under trade. For instance, in villages, the potter sells the articles he makes, the fisherman deals in the fish he catches and the blacksmith trades in the articles he prepares. These are brought under industry, while those only who are engaged exclusively in selling are classed as traders.

280. The total number supported by this sub-class in the Province is 71,729 or 12 per mille of the total population. Their distribution by principal orders of the Occupation scheme is noted in the margin. In every 100 persons supported by this sub-class, 39 are actual workers and the rest dependants; and again, the distribution of actual workers by cities and rural areas gives 31 per cent for the former and 69 per cent for the latter. Viewed by Natural Divisions, the Eastern Division contains a milleage of 12, while in the Western Division it is 7. The high milleage in the Eastern Division is due to the inclusion in it of the four cities, and more particularly of the Civil and Military Station, Bangalore, which contains a large proportion of this population.

281. A comparison of the statistics of 1911 with those of 1901 as given in Subsidiary Table VII shows that there is a net increase of 102.6 per cent, under sub-class VI—Public force. Under "Army—Native States" the increase is 585,350 per cent while under "Police" it is 2,962 per cent. The fluctuations are due to the regrouping of the figures of 1901 according to the new system of classification on the present occasion.

282. The number of persons in the Province supported by this sub-class is 132,867 or 229 per 10,000. They consist of persons employed in the service of

Order No.	Occupation	Number supported per 1,000 of total population

the State as well as in the Municipal, Muzrai, Palace and other Local Service (not village service), and include all village officials other than the village watchmen. Among them 55 in every 10,000 are actual workers. Their general distribution by districts and cities is shown in the marginally noted statement. It will appear

from it that in every 10,000 persons in the Province, Kolar District has the highest proportion of (37). Among cities, Mysore takes the lead with a proportion of (14) and next to it comes Bangalore (13). The high proportion in Mysore is due to the presence in it of a large number of Palace servants, while the location in the Bangalore City of the Principal Public Offices of

the State accounts for the large proportion noticed there.

Variation
in 1901-11.

283. On the present occasion 132,867 or 23 per mille have returned themselves under this sub-class as against 174,181 or 31 per mille in 1901.

Profes-
sions and
liberal
arts: sub-
class viii.

284. All persons supported by the five orders of (a) Religion, (b) Law, (c)

Sciences. Among the workers, the proportion of female to 1,000 males is 118 (Subsidiary Table VI); and viewed by orders, the proportion per 1,000 is 94 under Religion, 325 in Medicine, 765 in Midwifery, etc., 104 under Instruction, 131 in Letters, Arts and Sciences and 282 under Music, etc. The percentage distribution by districts and cities is given in the marginally noted statement. Mysore District has the highest percentage of 14, Bangalore and Kolar come next in the order of numerical

strength. Kadur District has the least percentage of 5. Among the cities, Mysore has the largest percentage of 9; Bangalore City comes next (8) and Kolar Gold Fields (City) has the least (1).

Variation
in 1901-11.

285. The number supported by this sub-class is 81,077 in 1911, as against 77,179 in 1901. The increase is but slight (5.1 per cent) and is commensurate with the general growth of population noticed in Chapter I.

sub-class
ix.

286. On the present occasion 20,935 persons have returned themselves under this sub-class as against almost the same number in 1901, viz., 20,943. It comprises all kinds of proprietors (other than of agricultural land), fund and scholarship holders and pensioners. Twelve are actual workers among them in every 10,000 of the total population; and the number of female actual workers per 1,000 males is 376.

Their millage distribution gives 63 for Civil and Military Station, Bangalore, 34 to Mysore City, 31 to Bangalore City and 2 to Kolar Gold Fields. In the

districts, it is 3 in Kolar; Bangalore, Tumkur, Shimoga and Hassan have 2 each; and in each of the districts of Mysore, Chitaldrug and Kadur it is 1.

287. The number returning *domestic service* as their occupation is 38,308. Domestic

They include cooks, water-carriers, private grooms, coachmen, etc., who find employment in domestic service for their

principal means of subsistence. They form 66 per 10,000 of the total population, 35 of whom are actual workers; the number of female workers per 1,000 males is 453. Their distribution per mille of population in cities and districts is given in the margin. The proportion is highest in Civil and Military Station, Bangalore, it being also high in the

other cities. Thus it will be seen that this occupation is essentially urban in its nature, the persons supported by it finding it easy to get employment as either coachmen, stable boys or cooks in towns and cities.

288. From Subsidiary Table VII it will be seen that there is a decrease of 58·3 per cent in this sub-class in the period under review due to the system of classification on the present occasion. Variation

289. All persons who returned their occupations in general terms which did not indicate a definite occupation have been included in this sub-class, and such persons number 400,349, forming 69 per 1,000 of the total population. The

marginal statement gives their distribution by districts and cities. The proportions are highest in the Kadur District and in the Bangalore City, being 132 and 130 respectively. Kolar Gold Fields has the least proportion of 38 per mille. Insuffi-

As compared with the figures of 1901, there is a decrease of 17·2 per cent in 1911. The decrease, which is partly

due to adjustment of the figures of 1901 reflects the extent to which instructions regarding the return of occupations were understood by the people and by the enumerators. The number of female workers per 1,000 males in this sub-class is 1,044.

290. In this sub-class are included the inmates of jails, asylums and hospitals, and beggars, etc. They number in all 51,965 or 89 per 10,000 of the total population. Taking them by orders, it will be found that 2 in every 10,000 are inmates of Jails, etc., while the remaining 87 subsist either as beggars and vagrants or as prostitutes. Unpro-

291. The total number of inmates of jails, etc., in the Province is 1,434 and

their percentage distribution among cities and districts is shown in the margin. The highest percentage is in the Bangalore City which contains 67, due to the location in it of the Bangalore Central Jail, where all the long-term convicts are confined. Next to Bangalore comes Mysore City with a percentage of 16. Chitaldrug and Shimoga also show a small percentage of 5 in each, due to the presence of a number of under-trial prisoners and convicts in the district headquarters where the Sessions Court holds its sittings once a quarter and in which persons charged with heinous criminal offences take their trial. Inmates

In this connection, it is necessary to say a few words about the convict population of the Central Jail of Bangalore. In this jail, several industrial works are undertaken by Government, principally those relating to carpet manufacture, weaving of cotton and wool, rope-making, carpentry, wood-working, etc., and the

prisoners who before their conviction were following one or other of these occupations are employed on these works. There were in the Bangalore Central Jail 223 convicts thus employed on the date of the Census. Of these, 127 were skilled workmen, 119 being males and the rest females. The unskilled convict labourers numbered 96, all of whom were males over 14 years of age.

Beggars,
vagrants
and
prosti-
tutes
Order 55.

292. This order comprises beggars, vagrants, prostitutes, etc., who make up the bulk of the proletariat class in the Province. They are most often houseless and penniless, and are obviously driven to seek their livelihood either by begging or by other means. They are chiefly found in large numbers at annual fairs or

jatras, seeking public charity for subsistence. They number in all 50,531 or 87 per 10,000; and are distributed among cities and districts as shown in the margin. The largest proportion is in the Kolar District, and this is accounted for by the Sri Ramanalingeswaraswami Jatra at Avani in the Mulbagal Taluk, lasting from 28th February to 12th March, and the Bhoga Nandeswaraswami Jatra and cattle show at Nandi in the Chikballapur Taluk, lasting from 27th February to

8th March. At each of these annual festivals more than 20,000 persons assemble, attracting a large number of beggars. In Bangalore and Tumkur Districts the proportions are also high and are due to the same cause. It may be remarked here that in some parts of the State, particularly in Chitaldrug District, a peculiar custom obtains among certain castes, of dedicating the eldest-born daughter for the service of the goddess of the place as *Basavi* (*vide* Chapters VII & XI). This has, however, begun to disappear under the influence of education, as from Census figures it will be seen that the proletariat population which in 1901 formed 17 per mille has considerably declined at the present Census, being only 9 per mille.

Taking the whole sub-class, it will be seen that in the period under review there is an increase of 108·1 per cent in the jail population, while beggars and prostitutes have decreased by 45·6 per cent.

A retros-
pect.

293. In the foregoing paragraphs the 'occupation statistics have been discussed in their various aspects. We have shown how agriculture dominates over all other occupations, forming a little over 73 per cent, and how indigenous handicrafts have come to be affected by the introduction of the power-driven machinery. During the decade under review, manual labour has been largely displaced by the labour-saving appliances, and a perceptible progress has been made in agriculture and industry as already reviewed in paragraphs 38 to 49 of Chapter II. Though there is an increase in the occupied area during the decade 1901-11, there has been no appreciable fall in the prices of staple food-grains which remain almost the same as in the previous decennium. This is chiefly due to the surplus produce finding a ready market outside the State by means of rail-borne trade.

The most satisfactory feature in the present industrial condition of the people of the Province is the impulse which is noticed in the attraction of capital for the formation of several Joint Stock Companies and Co-operative Societies for promoting scientific agriculture, trade and other industries.

PART IV.—OCCUPATION BY CASTE.

Review of
occupa-
tions by
castes.

294. We will close this chapter with a brief review of the occupation statistics by caste. These are contained in Table XVI, and their salient features have been brought out in Subsidiary Table VIII. It is therefore unnecessary to enter into a detailed discussion of them here. It will be enough to examine how some castes have adhered tenaciously to their traditional occupations and how others have seceded from them and taken to other calls in life for their principal means of subsistence.

The different castes in the Province, as in other parts of India, have each a distinctive occupation of its own which finds its origin in the religious scriptures and has been fostered by long usage. Originally, Brahmans were the priests; Kshattriyas were the dominant military class and rulers of the country; Vaisyas or Komatis were engaged exclusively in trade; and Sudras comprising most of the artisan castes were the servants of the above three classes. As admitted on all hands, these different classes indicate the conditions of an old order of things when people had to defend their country against their foreign enemies and to depend on their own resources. In course of time, sub-divisions of these original castes were made, and many new ones came into existence.

The limitations imposed by caste rules on occupation have now lost much of their rigour and a person can follow whatever occupation he might choose as his principal means of livelihood consistent with his convenience and adaptability.

From Table XVI. it will be seen that the Vakkaligas are faithful to their traditional occupation as cultivators, no less than 80 per cent of actual workers clinging to agriculture. Of the remaining 20, 9 follow other non-agricultural pursuits included in sub-class I, 1 has taken to mining and industry, 2 are engaged in transport or trade, 1 is in the service of the State and 7 follow other occupations. Next to them come Tigalas in their adherence to cultivation. 67 in 100 persons are cultivators, 9 traders, 6 non-agriculturists, 5 are engaged in mining and industry, 2 are in public service and the rest follow other pursuits. Of the priestly class of Brahmans, 48 per cent depend on agriculture, 30 are employed in public service and only 6 are priests. Among Komatis (Vaisyas) 56 per cent are traders, 10 per cent follow agriculture and the rest have taken to other callings. In every 100 Kshattriyas 6 follow their traditional occupation; and of the rest 48 are cultivators, 15 follow mining and other industries, 10 are engaged in transport and trade, 9 are in the public service of the State constituting the public force and public administration and 12 have taken to other pursuits. Among Kumbharas, 51 per cent are potters, 38 follow agriculture and the rest other occupations. In the Agasa or washerman caste 46 per cent are washermen, another 46 per cent cultivators, and the remaining 8 are engaged either in trade, industry or other business. The traditional occupation has almost disappeared among Bestas, Gollas and Upparas, not more than 2 per cent in each following it. Of the rest, many castes have taken to agriculture while a few others pursue other calls in life. The Beda caste has almost completely given up its time-honoured occupation of hunting, most of the Bedas having taken to agriculture.

Turning to non-Hindu tribes and races, we see from a reference to Subsidiary Table VIII, that among Musalmans, Pathans are most agricultural and Saiyids the least, the number per 1,000 workers engaged in cultivation being 335 and 295 respectively. The Musalmans figure largely as traders and general labourers also. In every 1,000, 71 among Pathans, 49 among Saiyids and 47 among Sheikhs are in the public force.

Among European Christians, 569 in every 1,000 are in the State service constituting the public force, 128 are engaged in the extraction of minerals and 102 follow arts and professions. Of the 1,000 workers among Anglo-Indian Christians, 227 are employed in the extraction of minerals, 144 in transport, and the rest follow other occupations. Among the Indian Christians, 192 in 1,000 are in the domestic service, other occupations also evenly engaging them.

Among the Animists, 427 in 1,000 are cultivators, 390 labourers, 102 follow trade and the rest 81 have taken to other pursuits.

295. It would appear, further, that in Civil and Military Station, Bangalore, Persons where alone the Income Tax Act of 1886 is in force within the territories of assessed Mysore, there were 333 persons assessed to such tax during 1910-11, of whom to Income 215 were traders, 73 owners of property, 37 belonged to professions, 4 were Tax. manufacturers and the remaining 4 were returned under other occupations. On (Under examining the figures by races or castes, it is found that the Europeans form 15 Part IV of the 1 per cent, Jains 11 per cent, Kachi Memans 9 per cent, Labbais 9 per cent, the Vellalas and Vaisyas 7 per cent, each, Sheikhs 5 per cent, Brahmans 4 per cent and Income-Tax Act of Anglo-Indians 4 per cent, the other castes, all put together, claiming 29 per cent. 1886).
